

Clinical trial results:

A 52-week, phase 3, multicentre, randomised, double blind, efficacy and safety study, comparing GSK3196165 with placebo and with tofacitinib in combination with conventional synthetic DMARDs, in participants with moderately to severely active rheumatoid arthritis who have an inadequate response to conventional synthetic DMARDs or biologic DMARDs.

Summary

EudraCT number	2019-000867-26

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	09 March 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	18 January 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To compare the efficacy of GSK3196165 at doses of 90 mg and 150 mg weekly versus placebo for the treatment of participants with moderately to severely active RA who are on a stable background of csDMARDs and who have had an inadequate response to csDMARDs or bDMARDs.

Protection of trial subjects:

Not Applicable

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	05 June 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Argentina: 187
Country: Number of subjects enrolled	Australia: 6
Country: Number of subjects enrolled	Bulgaria: 80

Country: Number of subjects enrolled	Japan: 224
Country: Number of subjects enrolled	Mexico: 124
Country: Number of subjects enrolled	Poland: 467
Country: Number of subjects enrolled	Russian Federation: 141
Country: Number of subjects enrolled	Korea, Democratic People's Republic of: 27
Country: Number of subjects enrolled	Spain: 11
Country: Number of subjects enrolled	Thailand: 9
Country: Number of subjects enrolled	United Kingdom: 11
Country: Number of subjects enrolled	United States: 167
Worldwide total number of subjects	1764
EEA total number of subjects	658

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	1375
From 65 to 84 years	388
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

For Global and Asia cohorts, participants were randomized in ratio of 6:6:3:1:1:1 to 3 experimental and 3 Placebo arms. At Week 12, participants from one of the three placebo arms switched to experimental arms, receiving intervention for 40 weeks. Participants who were randomized to experimental arms from day 1, received intervention for 52 weeks.

Pre-assignment

Screening details:

Total of 1764 participants were enrolled (1625 in Global and 139 in Asia cohorts which is supplementary to Global Cohort). One participant from GSK3196165 150mg (Asia cohort) arm was randomized but not treated. Study was terminated early only for Asia Cohort as limited efficacy did not support benefit risk profile of Otilimab as potential treatment.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	GSK3196165 90mg + csDMARD (Global Cohort)

Arm description:

Participants in Global Cohort received GSK3196165 90 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with conventional synthetic disease-modifying antirheumatic drugs (csDMARD).

Arm type	Experimental
Investigational medicinal product name	GSK3196165
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received GSK3196165 90 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with csDMARD.

Arm title	GSK3196165 150mg + csDMARD (Global Cohort)
------------------	--

Arm description:

Participants in Global Cohort received GSK3196165 150 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with csDMARD.

Arm type	Experimental
Investigational medicinal product name	GSK3196165
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received GSK3196165 150 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with csDMARD.

Arm title	Tofacitinib 5mg + csDMARD (Global Cohort)
------------------	---

Arm description:

Participants in Global Cohort received Tofacitinib 5mg capsule, orally, twice daily (BID) in combination

with csDMARD plus placebo injection weekly to maintain the blind for 52 weeks

Arm type	Active comparator
Investigational medicinal product name	Tofacitinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Participants received Tofacitinib 5mg capsule, orally, twice daily (BID) in combination with csDMARD plus placebo injection weekly to maintain the blind for 52 weeks

Arm title	Placebo+csDMARD and GSK3196165 90mg+csDMARD (Global Cohort)
------------------	---

Arm description:

Participants in Global Cohort received Placebo weekly SC injection in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo to GSK3196165 90 mg, SC injection, once weekly in combination with csDMARD until 52 weeks

Arm type	Placebo
Investigational medicinal product name	GSK3196165
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received GSK3196165 90 mg, SC injection, once weekly in combination with csDMARD from week 12 to week 52.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received Placebo weekly SC injection in combination with csDMARD until Week 12.

Arm title	Placebo +csDMARD and GSK3196165 150mg +csDMARD (Global Cohort)
------------------	--

Arm description:

Participants in Global Cohort received Placebo weekly SC injection in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo to GSK3196165 150 mg, SC injection, once weekly in combination with csDMARD until 52 weeks

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received Placebo weekly SC injection in combination with csDMARD until Week 12.

Investigational medicinal product name	GSK3196165
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Participants received GSK3196165 150 mg, SC injection, once weekly in combination with csDMARD from week 12 to week 52.

Arm title	Placebo +csDMARD and Tofacitinib 5mg +csDMARD (Global Cohort)
Arm description: Participants in Global Cohort received Placebo capsule BID in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo capsule to Tofacitinib 5mg, capsule, orally, BID in combination with csDMARD plus placebo injection to maintain the blind for 52 weeks.	
Arm type	Placebo
Investigational medicinal product name	Tofacitinib
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use
Dosage and administration details: Participants received Tofacitinib 5mg, capsule, orally, BID in combination with csDMARD plus placebo injection to maintain the blind from week 12 to week 52 weeks.	
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Injection
Routes of administration	Subcutaneous use
Dosage and administration details: Participants received Placebo weekly SC injection in combination with csDMARD until Week 12.

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: Total 1764 participants were randomized; one participant withdrew from 150mg GSK3196165 (Asia Cohort) before receiving intervention due to Physician Decision. The participant was removed from intent-to-treat and safety population (N=1763).

Secondary: Change from Baseline in Health Assessment Questionnaire Disability Index (HAQ-DI) at Week 12 (Global Cohort)

End point title	Change from Baseline in Health Assessment Questionnaire Disability Index (HAQ-DI) at Week 12 (Global Cohort) ^[6]
-----------------	---

End point description:

Health Assessment Questionnaire-Disability Index (HAQ-DI) is 20-question instrument that assesses degree of difficulty in accomplishing tasks in eight functional areas: dressing and grooming, arising, eating, walking, hygiene, reach, grip and common daily activities. Overall HAQ-DI score is sum of domain scores divided by number of domains answered. The score ranges from 0 to 3 where 0=least difficulty and 3=extreme difficulty. Higher overall score indicates greater disability. A negative change from baseline indicates an improvement. Baseline was defined as latest pre-dose assessment with a non-missing value, including from unscheduled visits. Change from Baseline was calculated by subtracting post dose value from Baseline. For the purpose of all analyses up to week 12, placebo arms were pooled into single placebo arm to primarily serve as reference for comparison of active treatment arms. The analysis was performed on ITT set using multiple imputation method to handle missing data.

Clinical Disease Activity Index (CDAI) total score is a composite score consisting of the sum of Swollen Joint Count 28 (SJC28), Tender Joint Count 28 (TJC28), Patient's Global Assessment of Arthritis Disease Activity (PtGA) (visual analogue scale with values from 0=best to 100=worst) and Physician Global Assessment of Arthritis Disease Activity (PhGA) (visual analogue scale with values from 0=best to 100=worst). PtGA and PhGA are transformed to a 0-10 scale before computing the CDAI total score. CDAI total score ranges from 0 to 76 with higher values representing higher disease activity. CDAI remission is achieved when CDAI total score ≤ 2.8 . The analysis was performed on all randomized participants who switched from placebo to study intervention at Week 12. Analysis was performed using multiple imputation method to handle missing data.

Secondary: Percentage of participants achieving DAS28 ESR <2.6 (DAS28-ESR Remission) at Week 24 and Week 52 for placebo switched arms (Global Cohort)

End point title	Percentage of participants achieving DAS28 ESR <2.6 (DAS28-ESR Remission) at Week 24 and Week 52 for placebo switched
-----------------	---

End point description:

The DAS28-ESR is a measure of RA disease activity calculated using Tender Joint Count 28 (TJC28), Swollen Joint Count 28 (SJC28), Erythrocyte sedimentation rate (ESR) (in mm/hr), Patient's Global Assessment of Arthritis Disease Activity (PtGA) (visual analogue scale with values from 0=best to 100=worst). DAS28-ESR scores range from 1.0 to 9.4, where lower scores indicate less disease activity. Remission is achieved when DAS28-ESR <2.6. A negative change from baseline in DAS28-ESR indicates an improvement. The analysis was performed on all randomized participants who switched from placebo to study intervention at Week 12. Analysis was performed using multiple imputation method to handle missing data.

Secondary: Change from Baseline in DAS28-CRP/DAS28-ESR at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Global Cohort)

End point title	Change from Baseline in DAS28-CRP/DAS28-ESR at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Global Cohort) ^[40]
-----------------	---

End point description:

DAS28-CRP and DAS28-ESR are measure of RA disease activity calculated using Swollen Joint Count 28 (SJC28), Tender Joint Count 28 (TJC28), high sensitivity C-reactive Protein (hsCRP in mg/L)/Erythrocyte sedimentation rate (ESR) [ESR in millimeter/hour (mm/hr)] and patient's global assessment of disease activity (PtGA) transformed to a 0-10 scale. Total score range from 0-9.4, with higher scores indicating more disease activity. Baseline was defined as the latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting the post dose visit value from the Baseline value. The analysis was performed on all randomized participants who received study intervention from Day 01 to Week 52. Analysis was performed using multiple imputation method to handle missing data.

End point title	Change from Baseline in SF-36 domain scores at Week 12 (Global Cohort) ^[51]
-----------------	---

End point description:

SF-36 is a health-related survey that assesses quality of life covering 8 domains: physical functioning (PF), bodily pain (BP), role limitations due to physical/emotional problems, general health (GH), mental health (MH), social functioning (SF), vitality. The MCS consists of 4 domains (SF, MH, vitality, role-emotional) and PCS consists of 4 domains (PF, role-physical, BP, GH). The individual question items are first summed for each item under the various sections. Then, those domain scores are weighted to a scale between 0 to 100, where higher score represents better health. Positive change from baseline indicates an improvement. Quality Metric software was used for scoring for SF-36. Baseline was defined as latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting post dose visit value from Baseline value. ITT set was analyzed for participants with data available at the indicated time points.

Secondary: Change from Baseline in SF-36 mental component scores at Week 12 (Global Cohort)

End point title	Change from Baseline in SF-36 mental component scores at Week 12 (Global Cohort) ^[52]
-----------------	--

End point description:

SF-36 survey evaluates health-related quality of life, covering physical functioning, bodily pain, role limitations due to physical/emotional issues, general health, mental health (MH), social functioning (SF), vitality. Each of 8 domains is scored using average, 0-100; higher score represents better health. MCS was aggregated across the domains and scaled to T-score with mean of 50 and SD of 10; higher score represents better health. MCS is primarily derived from 4 domains (SF, MH, vitality, role-emotional) representing overall mental health. Positive change from baseline, reported using T-score change, indicates improvement in overall mental health. Quality Metric software was used for scoring. Baseline was defined as most recent pre-dose NMV, including unscheduled visits. CB=subtracting PD value from BV. For analysis up to week 12, placebo arms were pooled into single arm to serve as reference for active treatment arm comparison. ITT set was analyzed using multiple imputation to manage missing data.

Secondary: Change from Baseline in FACIT-Fatigue at Week 24 and Week 52 for placebo switched arms (Global Cohort)

End point title	Change from Baseline in FACIT-Fatigue at Week 24 and Week 52 for placebo switched arms (Global Cohort) ^[62]
-----------------	--

End point description:

The Functional Assessment of Chronic Illness Therapy (FACIT)-fatigue is a validated patient-reported measure of 13 statements regarding the feeling of fatigue. The total score ranges from 0 to 52 with higher values representing a lower fatigue and a better quality of life. A positive change from baseline in FACIT-fatigue indicates an improvement. Baseline was defined as the latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting the post dose visit value from the Baseline value. Participants who received study intervention from Week 12 to Week 52 were analyzed. For efficacy assessments baseline is interpreted as Day 1. Missing data was handled by multiple imputation method.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline (Day 1), Week 24 and Week 52

Notes:

[62] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The endpoints are different for the different parts of the study.

End point description:

Blood samples were collected for the assessment of clinical chemistry parameter total bilirubin level. Baseline was defined as the latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting the post dose visit value from the Baseline value. For safety assessments baseline is interpreted as Week 12. The analysis was performed on the Safety Set. Only those participants with data available at the specified data points were analyzed.

End point title	Change from Baseline in Health Assessment Questionnaire Disability Index (HAQ-DI) at Week 12 (Asia Cohort) ^[126]
-----------------	---

End point description:

Health Assessment Questionnaire-Disability Index (HAQ-DI) is 20-question instrument that assesses degree of difficulty in accomplishing tasks in eight functional areas: dressing and grooming, arising, eating, walking, hygiene, reach, grip and common daily activities. Overall HAQ-DI score is sum of domain scores divided by number of domains answered. The score ranges from 0 to 3 where 0=least difficulty and 3=extreme difficulty. Higher overall score indicates greater disability. A negative change from baseline indicates an improvement. Baseline was defined as latest pre-dose assessment with a non-missing value, including from unscheduled visits. Change from Baseline was calculated by subtracting post dose value from Baseline. Placebo arms were pooled into single placebo arm to primarily serve as reference for comparison of active treatment arms. Analysis was performed on ITT-Supplementary Asia Cohort set. Secondary: Percentage of participants achieving CDAI total score ≤ 2.8 (CDAI Remission) at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Asia Cohort)

End point title	Percentage of participants achieving CDAI total score ≤ 2.8 (CDAI Remission) at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Asia Cohort) ^[131]
-----------------	--

End point description:

Clinical Disease Activity Index (CDAI) total score is a composite score consisting of the sum of Swollen Joint Count 28 (SJC28), Tender Joint Count 28 (TJC28), Patient's Global Assessment of Arthritis Disease Activity (PtGA) (visual analogue scale with values from 0=best to 100=worst) and Physician Global Assessment of Arthritis Disease Activity (PhGA) (visual analogue scale with values from 0=best to 100=worst). PtGA and PhGA are transformed to a 0-10 scale before computing the CDAI total score. CDAI total score ranges from 0 to 76 with higher values representing higher disease activity. CDAI remission is achieved when CDAI total score ≤ 2.8 . Percentage values are rounded off. The analysis was performed on all randomized Asia Cohort participants who received study intervention from Day 01 to Week 52. Participants with data available at indicated timepoints are analyzed.

Secondary: Percentage of participants achieving DAS28-CRP <2.6 (DAS28-CRP Remission) at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Asia Cohort)

End point title	Percentage of participants achieving DAS28-CRP <2.6 (DAS28-CRP Remission) at Week 24 and Week 52 for treatment arms who started study intervention from Day 1 (Asia Cohort) ^[144]
-----------------	--

End point description:

The DAS28-CRP is a measure of RA disease activity calculated using Tender Joint Count 28 (TJC28), Swollen Joint Count 28 (SJC28), C-reactive protein (CRP) (in mg/L), Patient's Global Assessment of Arthritis Disease Activity (PtGA) (visual analogue scale with values from 0=best to 100=worst). DAS28-CRP scores range from 1.0 to 9.4, where lower scores indicate less disease activity. Remission is achieved when DAS28-CRP less than (<)2.6. A negative change from baseline in DAS28-CRP indicates an improvement. Percentage values are rounded off. The analysis was performed on all randomized Asia Cohort participants who received study intervention from Day 01 to Week 52. Participants with data available at indicated timepoints are analyzed.

Secondary: Change from Baseline in CDAI total score at Week 24 and Week 52 for placebo switched arms (Asia Cohort)

End point title	Change from Baseline in CDAI total score at Week 24 and Week 52 for placebo switched arms (Asia Cohort) ^[159]
-----------------	--

End point description:

Clinical Disease Activity Index (CDAI) total score is a composite score consisting of sum of Swollen Joint Count 28 (SJC28), Tender Joint Count 28 (TJC28), Patient's Global Assessment of Arthritis Disease Activity (PtGA) and Physician Global Assessment of Arthritis Disease Activity (PhGA) (VAS with values from 0=best to 100=worst). PtGA and PhGA are transformed to a 0-10 scale. CDAI total score ranges from 0 to 76 with higher values representing higher disease activity. Low disease activity (LDA) is achieved when CDAI total score ≤ 10 . Baseline was defined as latest pre-dose assessment with a NMV, including from unscheduled visits. Change from Baseline was calculated by subtracting PDV from BV. For efficacy assessments baseline is interpreted as Day 1. Analysis was performed on participants who received study intervention from Week 12 to Week 52 IN Asia Cohort with data available at indicated timepoints were analyzed.

End point type	Secondary

Secondary: Change from Baseline in Arthritis pain VAS at Week 24 and Week 52 for placebo switched arms (Asia Cohort)

End point title	Change from Baseline in Arthritis pain VAS at Week 24 and Week 52 for placebo switched arms (Asia Cohort) ^[175]
-----------------	--

End point description:

For the Arthritis Pain VAS, participants assess the severity of their current arthritis pain using a continuous visual analogue scale (VAS) with anchors at "0" (no pain) and "100" (most severe pain). A negative change from baseline indicates an improvement. Baseline was defined as the latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting the post dose visit value from the Baseline value. For efficacy assessments baseline is interpreted as Day 1. The analysis was performed on all randomized Asia Cohort participants who switched from placebo to study intervention at Week 12. Participants with data available at indicated timepoints are analyzed.

Secondary: Change from Baseline in Functional assessment of chronic illness therapy (FACIT)-Fatigue at Week 12 (Asia Cohort)

End point title	Change from Baseline in Functional assessment of chronic illness therapy (FACIT)-Fatigue at Week 12 (Asia Cohort) ^[184]
-----------------	--

End point description:

The Functional Assessment of Chronic Illness Therapy (FACIT)-fatigue is a validated patient-reported measure of 13 statements regarding the feeling of fatigue. The total score ranges from 0 to 52 with higher values representing a lower fatigue and a better quality of life. A positive change from baseline in FACIT-fatigue indicates an improvement. Baseline was defined as latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting post dose visit value from Baseline value. For the purpose of all analyses up to week 12, the placebo arms were pooled into a single placebo arm to primarily serve as a reference for the comparison of active treatment arms. The analysis was performed on ITT-Supplementary Asia Cohort set. Participants with data available at indicated timepoints are analyzed.

End point type	Secondary
----------------	-----------

End point timeframe:

Baseline (Day 1) and Week 12

Notes:

[184] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The endpoints are different for the different parts of the study.

End point values	GSK3196165 90mg + csDMARD (Asia Cohort)	GSK3196165 150mg + csDMARD (Asia Cohort)	Tofacitinib 5mg + csDMARD (Asia Cohort)	Pooled Placebo (Asia Cohort)

Secondary: Change from Baseline in lipid profile parameter of LDL cholesterol, high-density lipoprotein-cholesterol at Week 24 for treatment arms who started study intervention from Day 1 (Asia Cohort)

End point title	Change from Baseline in lipid profile parameter of LDL cholesterol, high-density lipoprotein-cholesterol at Week 24 for treatment arms who started study intervention from Day 1 (Asia Cohort) ^[222]
-----------------	---

End point description:

Blood samples were collected for the assessment of fasting lipid profile including LDL cholesterol, HDL cholesterol levels. Baseline was defined as the latest pre-dose assessment with a non-missing value, including those from unscheduled visits. Change from Baseline was calculated by subtracting the post dose visit value from the Baseline value. Blood samples were collected at indicated time points per schedule of assessment in protocol. Objectives and Endpoints section incorrectly states that Change from baseline in key laboratory parameters at Week 24 was a secondary objective, however for lipid

panel, there is no corresponding time point in schedule of assessment. Consequently, the objective that can be assessed for the lipid panel is Week 16 and not Week 24 as no data collected. Week 16 is not pre-specified time point to report.

End point type	Secondary
End point timeframe:	
Baseline (Day 1) and Week 24	

Notes:

[222] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The endpoints are different for the different parts of the study.

End point values	GSK3196165 90mg + csDMARD (Asia Cohort)	GSK3196165 150mg + csDMARD (Asia Cohort)	Tofacitinib 5mg + csDMARD (Asia Cohort)

End point title	Number of participants with anti-GSK3196165 antibodies (Asia Cohort) ^[256]
-----------------	---

End point description:

Serum samples were collected for the determination of anti- GSK3196165 antibodies (ADA) using a validated electrochemiluminescence (ECL) immunoassay. The assay involved screening, confirmation and titration steps. If serum samples tested positive in the screening assay, they were considered 'potentially positive' and were further analyzed for the specificity using the confirmation assay. Samples that confirmed positive in the confirmation assay were reported as 'positive'. Confirmed positive ADA samples were further characterized in the titration assay to quasi-quantitate the amount of ADA in the sample. Additionally, confirmed positive ADA samples were also tested in a validated neutralizing antibody assay to determine the potential neutralizing activity of the ADA.

Statistical analyses

No statistical analyses for this end point

Secondary: Number of participants with adverse events (AEs), serious adverse events (SAEs) and adverse events of special interest (AESI) for placebo switched arms (Asia Cohort)

End point title	Number of participants with adverse events (AEs), serious adverse events (SAEs) and adverse events of special interest (AESI) for placebo switched arms (Asia Cohort) ^[259]
-----------------	--

End point description:

An AE is any untoward medical occurrence in a clinical study participant, temporally associated with the use of a study intervention, whether or not considered related to the study intervention. A SAE is any untoward medical occurrence that, is life-threatening, requires inpatient hospitalization or prolongation of existing hospitalization, results in persistent disability/incapacity and/or can result in death. The analysis was performed on Safety Set of switched arms that collected data from Week 12 to 59.

End point type	Secondary
----------------	-----------

End point timeframe:

Week 12 to Week 59

Notes:

[259] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: The endpoints are different for the different parts of the study.

End point values	Placebo + csDMARD and GSK3196165 90mg + csDMARD (Asia Cohort)	Placebo + csDMARD and GSK3196165 150mg + csDMARD (Asia Cohort)	Placebo + csDMARD and Tofacitinib 5mg + csDMARD (Asia Cohort)	
Subject group type	Reporting group	Reporting group	Reporting group	
Number of subjects analysed	6	8	8	
Units: Participants				
Participants with AE	6	5	7	
Participants with SAE	0	1	0	
Participants with AESI	0	0	0	

Statistical analyses

Secondary: Number of participants with National Cancer Institute-Common terminology criteria for adverse events (NCI-CTCAE) ≥ Grade 3 hematological/clinical chemistry abnormalities for placebo switched arms (Asia Cohort)

End point title	Number of participants with National Cancer Institute-Common terminology criteria for adverse events (NCI-CTCAE) ≥ Grade 3 hematological/clinical chemistry abnormalities for placebo switched arms (Asia Cohort) ^[260]
-----------------	--

End point description:

Number of participants with NCI-CTCAE ≥ Grade 3 hematological/clinical chemistry abnormalities were summarized. Hematological and Clinical chemistry parameters were summarized according to the NCI-CTCAE, version 5.0: Grade 1: mild; Grade 2: moderate; Grade 3: severe; Grade 4: life-threatening or disabling. Higher grade indicates more severity. Data is presented for only those parameters for which participants had worst case ≥ Grade 3 shifts from Baseline. The analysis was performed on Safety Set of switched arms that collected data from Week 12 to 59.

End point type	Secondary

Adverse events

Adverse events information

Timeframe for reporting adverse events:

For Global and Asia cohorts, Pooled Placebo arm collected during the timeframe Week 0 to Week 12. Placebo switched to active treatment arms collected during the timeframe Week 12 to Week 59. Experimental arms collected during from Week 0 to Week 59.

Adverse event reporting additional description:

Fifteen participants in Placebo group received active treatment of Tofacitinib mistakenly from Week 4 instead of Week 12 as planned. They were added with the Tofacitinib arm in safety analysis.

Assessment type	Systematic

Reporting groups

Reporting group title	GSK3196165 90mg + csDMARD (Global Cohort)
-----------------------	---

Reporting group description:

Participants in Global Cohort received GSK3196165 90 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with conventional synthetic disease-modifying antirheumatic drugs (csDMARD).

Reporting group title	GSK3196165 150mg + csDMARD (Global Cohort)
-----------------------	--

Reporting group description:

Participants in Global Cohort received GSK3196165 150 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with csDMARD.

Reporting group title	Tofacitinib 5mg + csDMARD (Global Cohort)
-----------------------	---

Reporting group description:

Participants in Global Cohort received Tofacitinib 5mg capsule, orally, twice daily (BID) in combination with csDMARD plus placebo injection weekly to maintain the blind for 52 weeks

Reporting group title	Pooled Placebo (Global Cohort)
-----------------------	--------------------------------

Reporting group description:

Participants received Placebo weekly SC injection in combination with csDMARD until Week 12. The placebo arms are pooled into a single placebo arm.

Reporting group title	Placebo+csDMARD and GSK3196165 90mg+csDMARD (Global Cohort)
-----------------------	---

Reporting group description:

Participants in Global Cohort received Placebo weekly SC injection in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo to GSK3196165 90 mg, SC injection, once weekly in combination with csDMARD until 52 weeks

Reporting group title	Placebo +csDMARD and GSK3196165 150mg +csDMARD (Global Cohort)
-----------------------	--

Reporting group description:

Participants in Global Cohort received Placebo weekly SC injection in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo to GSK3196165 150 mg, SC injection, once weekly in combination with csDMARD until 52 weeks

Reporting group title	Placebo +csDMARD and Tofacitinib 5mg +csDMARD (Global Cohort)
-----------------------	---

Reporting group description:

Participants in Global Cohort received Placebo capsule BID in combination with csDMARD for 12 weeks. At week 12, participants were switched from placebo capsule to Tofacitinib 5mg, capsule, orally, BID in combination with csDMARD plus placebo injection to maintain the blind for 52 weeks.

Reporting group title	GSK3196165 90mg + csDMARD (Asia Cohort)
-----------------------	---

Reporting group description:

Participants in Asia Cohort received GSK3196165 90 mg subcutaneous (SC) injection once weekly for 52 weeks in combination with csDMARD.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 May 2019	Correction of contraceptive requirements for Women of Child Bearing Potential (WOCBP) and additional clarifications.
21 January 2020	To detail revised risks, entry and stopping criteria following the update to comparator drug (tofacitinib) label. To introduce new medical device safety reporting wording, required in advance of roll out of pre-filled syringes to this study. Other minor corrections and clarifications.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
