Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	03 March 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	24 June 2024
Global end of trial reached?	Yes
Global end of trial date	24 June 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the study was to improve Day 28 GvHD complete response rate for Ann Arbor score 2 or 3 GvHD patients from the historical rate of 37% to 52% by treatment with ECP and high dose methylprednisolone (2 mg/kg) or equivalent dose prednisolone.

Protection of trial subjects:

This study was conducted in accordance with applicable ICH/GCP regulations and guidelines, the general principles set forth in the Declaration of Helsinki, and all applicable regulatory requirements. Prior to the start of the study, the study protocol was reviewed and approved by an independent ethics committee (IEC).
Prior to any study-related procedures, subjects were informed by a principal investigator about all procedures and counseled regarding the risks and benefits of the study. Patients were always given sufficient time to ask questions and decide whether they wished to participate in the study. Prior to any study-related procedures, written informed consent was obtained from the patients and the approving investigators.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	11 March 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Austria: 1
Country: Number of subjects enrolled	Germany: 23
Worldwide total number of subjects	24
EEA total number of subjects	24

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23	0

months)	
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	19
From 65 to 84 years	5
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This study was conducted in 3 sites in Germany and 1 site in Austria. The sites were located at university hospitals with a focus on stem cell transplantation .

Pre-assignment

Screening details:

The screening process started after the patient was diagnosed with aGvHD (Glucksberg grade IIIV) following allogeneic SCT and after Informed Consent was collected. Sceening period time was Day -5 to Day 0. Patient eligibility was determined locally, except Ann Arbor scoring was measured centrally using standard technical procedures.

Pre-assignment period milestones

Number of subjects started	52[1]
Number of subjects completed	24

Pre-assignment subject non-completion reasons

Reason: Number of subjects	Screening failures: 27
Reason: Number of subjects	Consent withdrawn by subject: 1

Notes:

[1] - The number of subjects reported to have started the pre-assignment period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.
Justification: Number started pre-assignment period are all screened patients. Number of worldwide enrolled are the patients who entered the trial for treatment (without screening failures).

Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	ECP plus standard steroid treatment

Arm description:

Days 0-56: ECP 3x/week in Week 1 and Week 2. 2x/week in Week 3 and Week 4, then once weekly until Day 56.
Protocol treatment with ECP had to start within 5 working days (=7 days) after initiation of systemic steroid treatment for aGvHD. Dose of methylprednisolon 2 mg/kg/day orally or i.v. (or prednisone equivalent). The dose of steroids could not be tapered before 3 days of initiation of study therapy (=first ECP, defined as Day 0), but afterwards local institutional tapering practices could be followed.
Weeks 10, 12 and Months 6, 9, 12: Follow-up Period. Patients were followed 1 year after removal from treatment or intil death, whichever accures first.

Arm type	Experimental
Investigational medicinal product name	UVADEX
Investigational medicinal product code	
Other name	methoxsalen, 8-methoxypsoralen
Pharmaceutical forms	Solution for infusion in administration system
Routes of administration	Extracorporeal use

Dosage and administration details:

UVADEX™ was supplied as a sterile solution containing methoxsalen 20 mcg, propylene glycol 50 mg, sodium chloride 8 mg, sodium acetate 1.75 mg, ethanol 40.550 mg, glacial acetic acid 1.260 mg, and water for injection q.s. to 1.0 mL. Glacial acetic acid and sodium hydroxide were used to adjust the pH of the solution if necessary.
UVADEX™ was provided and distributed to the individual sites by Therakos (Mallinckrodt).

The ECP procedure was be performed according to manufacturer’s guidelines.
For the treatment, photopheresis consisted of removing a portion of the patient's blood and separating the red blood cells from the white cell layer (buffy coat) by centrifugation. The red cells were returned to the patient and the UVADEX™ sterile solution was then injected into the photopheresis system and mixed with the buffy coat. The instrument then irradiated this drug-cell mixture with ultraviolet light (UVA light, 320-400 nm) and returned the treated cells to the patient.

Number of subjects in period 1	ECP plus standard steroid treatment
Started	24
Completed	21
Not completed	3
Adverse event, serious fatal	3

Reporting group title	ECP plus standard steroid treatment

Reporting group description:

Days 0-56: ECP 3x/week in Week 1 and Week 2. 2x/week in Week 3 and Week 4, then once weekly until Day 56.
Protocol treatment with ECP had to start within 5 working days (=7 days) after initiation of systemic steroid treatment for aGvHD. Dose of methylprednisolon 2 mg/kg/day orally or i.v. (or prednisone equivalent). The dose of steroids could not be tapered before 3 days of initiation of study therapy (=first ECP, defined as Day 0), but afterwards local institutional tapering practices could be followed.
Weeks 10, 12 and Months 6, 9, 12: Follow-up Period. Patients were followed 1 year after removal from treatment or intil death, whichever accures first.

Primary: Complete response at Day 28 of study treatment

End point title	Complete response at Day 28 of study treatment[1]

End point description:

The primary endpoint was the proportion of CR at Day 28 of study treatment. Death, lack of CR at Day 28, or initiation of additional immunosuppressive therapy were considered failures for this endpoint. The following values show the proportion of CR together with a two-sided 90% exact Clopper-Pearson confidence interval (CI) and the p-value for the comparison with the historical rate of 0.37.
p-value < 0.001: for testing the null hypothesis that the CR rate is smaller or equal to the historical rate a binomial test with a one-sided type I error rate of 5% was used.

End point type	Primary

End point timeframe:

28 days after first ECP treatment (Day 0).

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.
Justification: Details are given in the description.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Data on all events meeting the criteria and defintion of an AE with CTCAE grade 3 or higher or SAE were collected from the time of consenting until the patient's follow-up phase .

Adverse event reporting additional description:

For the Safety evaluation, AEs during treatment (defined at time of ECP treatment + 28 days) were used.
Only events with CTCAE grade 3 , 4 and 5 (severe AEs and SAEs) were analysed.

Assessment type	Systematic

Dictionary used
