

Clinical trial results:

Erector Spinae plane block for minimal invasive mitral valve surgery. A double blind, prospective randomized placebo-controlled trial.

Summary

EudraCT number	2019-001125-27
Trial protocol	BE
Global end of trial date	04 November 2021

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	10 May 2022
Is this the analysis of the primary completion data?	Yes
Primary completion date	04 November 2021
Global end of trial reached?	Yes
Global end of trial date	04 November 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The goal of this study is to improve pain management after minimal invasive mitral valve surgery and to facilitate postoperative recovery. Our hypothesis is that patients having an Erector Spinae Block via intermittent bolus ropivacain via catheter is associated with a reduction in postoperative morphine consumption.

Protection of trial subjects:

Patients received acetaminophen (15 mg kg⁻¹) every 6 hours and morphine patient-controlled intravenous analgesia (PCIA) up to 24 hours post-extubation. Rescue analgesia consisted of a bolus of morphine, ketorolac, acetylsalicylic acid and/or removal or infiltration of chest tubes according to a standardized flowchart (supplementary figure S1). Twenty-four hours post-extubation, morphine PCIA was stopped and further analgesic treatment consisted of acetaminophen combined with tramadol or morphine.

Background therapy:

Irrespective of group allocation, every patient received a bolus of IV morphine (0.1 mg kg⁻¹) and acetaminophen IV (1g) at thorax closure. After having received the interventional treatment, patients were transferred intubated to the PACU under analgosedation with dexmedetomidine and remifentanyl. Following extubation (T0), patients received PCIA pump with morphine (on-demand-only mode with a morphine bolus of 1.5 mg up to every 7 minutes).

Evidence for comparator:

While in numerous case reports the ESP block has been described to adequately provide perioperative analgesia after adult cardiac surgery, the evidence from randomized controlled trials (RCT) is scarce. In the four RCTs that investigated the ESP block in adult cardiac surgery, bilateral ESP blocks were used for cardiac surgery cases requiring a sternotomy. In addition, double-blinding of allocation was limited to only 1 trial.

Actual start date of recruitment	02 July 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Belgium: 72
Worldwide total number of subjects	72
EEA total number of subjects	72

Notes:

Subjects enrolled per age group

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	33
From 65 to 84 years	39
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Recruitment details:

112 patients between July 2nd 2019 and November 4th 2021 were screened of whom 72 were eligible for participation.

Pre-assignment

Screening details:

All consecutive adult patients scheduled for either MIMVS were evaluated for enrollment according to the inclusion criteria. They were included if 18-80 years of age, BMI <35, EuroSCORE <3, admitted to the PACU with our epilepsy, chronic opioid use or OSAS without treatment.

Period 1

Period 1 title	Surgery (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Assessor

Blinding implementation details:

All patients were randomized through a computer-generated permuted block randomisation sequence (variable block-size with 1:1 allocation). Enclosing assignments in opaque, sequentially numbered, sealed envelopes ensured allocation concealment. Following uneventful surgery and confirmation of post-anesthesia care unit (PACU) admittance, the envelope was opened by research personnel and the trial medication was prepared. Syringes were then labelled with the mark "trial medication".

Arms

Are arms mutually exclusive?	Yes
Arm title	Intervention

Arm description:

After completion of the surgery, an ESP block (with placement of a catheter) was performed with 30mL of trial medication. There after, 20mL trial medication through the ESP-catheter at the PACU was given every 6 hours after the first dose (B0 +6h, B0 +12h, and B0 +18h), three times in total.

Arm type	Experimental
Investigational medicinal product name	Ropivacaine 0,5%
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection/infusion
Routes of administration	Injection

Dosage and administration details:

Dosage and administration details:

Initial dose of 30mL followed after 6, 12 and 18 hours with a dose of 20mL.

Arm title	Control
------------------	---------

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From enrollment until 24 hours after extubation.

Adverse event reporting additional description:

Incidence of adverse events (AE) related to the intervention or surgical procedure.

Early safety endpoints at 30 days as defined by Valve Academic Research Consortium-2 (VARC-2) (all-cause mortality, stroke, life-threatening bleeding, acute kidney injury (stage 2 or 3), major vascular complication or valve-related dysfunction) will be evaluated.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
22 March 2021	Extension of recruitment period due to COVID-19 Pandemic. In addition, the planned blinded interim analysis for sample size recalculation (September 22nd 2020) revealed the need to include 4 additional patients in each group.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
