Results analysis stage

Analysis stage	Final
Date of interim/final analysis	22 January 2026
Is this the analysis of the primary completion data?	Yes
Primary completion date	30 January 2025
Global end of trial reached?	Yes
Global end of trial date	30 January 2025
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To study the effect of rhGM-CSF on ulcer size reduction, when applied directly in the wound bed of difficult-to-heal venous leg ulcers, given on top of standard care. This was evaluated by measuring the ulcer area change after 4 weeks of treatment compared to placebo.

Protection of trial subjects:

For safety reasons, the study drug /placebo was applied in the outpatient wound clinic at the hospital with close monitoring of pain and immediate adverse events. During the treatment period with the study drug/placebo participants also received standard care by highly experienced wound care nurses at the center.

Participants were compensated for traveling expenses in accordance with the reimbursement policy.

Analgesics were offered in the case of pain.

Background therapy:

The following standard of care was performed twice a week in all participants (placebo/Repogel):

1. Ulcer debridement: mechanical or sharp debridement e.g. with a curette, performed at each visit, unless the procedure was too painful.
2. Ulcer irrigation: performed at every study visit with clean tap water
3. Dressing: Ulcers were dressed with a neutral non-medicated dressing at each visit according to the clinical routine in the department, reflecting the stage and needs of the individual wound. A preference list of dressing choices were made before inclusion. Active dressings such as silver-impregnated dressings or dressings with ibuprofen were not allowed. Dressing type was registered in the eCRF.
4. Compression therapy: Bandages with Coban 2TM, 3MTM were used. CobanTM ("Coban I") was also accepted
5. Periwound skin treatment: The use of moisturizing creams and protecting the wound border from maceration were used if clinically indicated

Home nurse visits: Some of the dressing changes were performed by the home care nurses or at nurses' clinics in the follow-up period (in accordance with clinical routines).

Evidence for comparator: -

Actual start date of recruitment	13 April 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Denmark: 6
--------------------------------------	------------

Worldwide total number of subjects	6
EEA total number of subjects	6

Notes:

Subjects enrolled per age group	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	2
From 65 to 84 years	4
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial was conducted at the Department of Dermatology and Copenhagen Wound Healing Center, Bispebjerg Hospital, Denmark. The first patient was randomized 13-04-2021 and the last patient finished the study 19-10-2021.

Pre-assignment

Screening details:

The target population consisted of adult patients suffering from difficult-to-heal venous leg ulcers, with an ulcer duration of ≥ 2 months and ≤ 3 years and an ulcer size 2-75 cm² at the randomization day.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description: -

Arm type	Placebo
Investigational medicinal product name	Hydrogel
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Gel
Routes of administration	Topical

Dosage and administration details:

Twice weekly for 4 weeks topically in the wound bed

Arm title	Repogel
------------------	---------

Arm description: -

Arm type	Experimental
Investigational medicinal product name	Repogel
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Gel
Routes of administration	Topical

Dosage and administration details:

Repogel containing rhGM-CSF (molgramostim) in a hydrogel with an aimed concentration of 50 mikrogram molgramostim per mL of hydrogel. The treatment was administered locally in the wound bed twice weekly for 4 weeks with a dosage of 5 mikrogram/cm² rhGM-CSF of wound bed. The ulcer area was calculated by means of Silhouette Star (Aranz medical) at every treatment visit, and the ulcer area at that visit determined the individual dose to be applied to the ulcer. The study drug/placebo was supplied in a transparent syringe of 10 mL, indicating the volume used.

The maximal dosage of molgramostim that could be given at each administration was 375 mikrogram.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
08 November 2021	<p>The current study was temporarily stopped by the Danish Medicines Agency 08. Nov. 2021, following an inspection at sponsors site, due to insufficient validation of the analysis methods of the study drug in the dosage form (Repogel) in batch BA055HBMH. rhGM-CSF in the hydrogel dosage form used in the study were shown as physically not stable due to the hypothesis of stress during manu-facturing process caused alteration of peptide chain over the time. As subjects were included sequentially and participating in the study over a 6-month period, the content of rhGM-CSF may have varied significantly between the patients. At this timepoint six patients were included in the study. With the necessary documentation, the study could be continued. Despite multiple attempts, it was observed that Repogel dosage form was not robust enough and quantification of rhGM-CSF was not reproducible. It was concluded that to achieve the necessary validation/documentation was not possible and therefore it was decided to stop the study and report on the six patients included. Finally a closure of the study was filed in January 2025 with the results of six patients only and without any statistically analysis due to very small sample size (n=6).</p> <p>A dose of 5 mikrogram of rhGM-CSF (molgramostim) per cm2 of wound bed was aimed at being used in the study. The study drug was administered twice a week for 4 consecutive weeks. The maximal dosage of molgramostim that could be given at each administration in our trial, 375 mikrogram.</p>	-

Notes:

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

No firm conclusions about the efficacy and safety of rhGM-CSF can be drawn from this study due to insufficient data and very few number of enrolled patients (n=6).

Notes:
