Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	16 November 2022
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	03 February 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of efgartigimod compared to placebo in achieving a sustained platelet count response in subjects with primary chronic immune thrombocytopenia (ITP), with a sustained platelet count response defined as platelet counts of at least $50 \times 10^9/L$ for at least 4 of the 6 visits between weeks 19 and 24 of the trial.

Protection of trial subjects:

This study was conducted according to the ICH GCP, the principles of the Declaration of Helsinki, and other applicable local ethical and legal requirements.

Background therapy:

Subjects receiving at least 1 permitted concurrent ITP therapy were eligible for the trial (if the dose and schedule have remained unchanged in the last 4 weeks before randomisation).

Evidence for comparator: -

Actual start date of recruitment	09 December 2019
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

From 65 to 84 years	23
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

This study was conducted at 71 active sites that enrolled patient in 18 countries. Recruitment started on 09 December 2019.

Pre-assignment

Screening details:

During the screening period (up to 2 weeks) the subject's eligibility for trial participation was evaluated. A total of 205 subjects were screened, of which 74 subjects were screen failures. 131 of 205 were enrolled and randomised at a ratio of 2:1 to receive efgartigimod or placebo.

Period 1

Period 1 title	Overall Period (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Efgartigimod

Arm description:

The subjects entered a 24-week treatment period and were randomised to receive efgartigimod 10 mg/kg intravenous (IV). The investigational medicinal product (IMP) infusion (efgartigimod) was administered weekly from visits 1 to 4, either weekly or every other week (q2w) from visits 5 to 16, and fixed on the dosing schedule of visit 16 (or the last visit at which IMP was administered) from visits 17 to 24 (ie, either weekly or q2w).

Arm type	Experimental
Investigational medicinal product name	Efgartigimod
Investigational medicinal product code	ARGX-113
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

The subjects received IV efgartigimod infusion 10 mg/kg (fixed dose) either weekly or q2W. The IV infusion was administered over the period of approximately 1 hour. The maximum total dose per efgartigimod infusion was 1200 mg for subjects with a body weight ≥ 120 kg measured at infusion visits.

Arm title	Placebo
------------------	---------

Arm description:

The subjects entered a 24-week treatment period and were randomized to receive placebo intravenous (IV). The placebo infusion was administered weekly from visits 1 to 4, either weekly or q2w from visits 5 to 16, and fixed on the dosing schedule of visit 16 (or the last visit at which placebo was administered) from visits 17 to 24 (ie, either weekly or q2w).

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Concentrate for solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

The subjects received The subjects received IV placebo infusion either weekly or q2w. The IV infusion was administered over the period of approximately 1 hour.

Secondary: Incidence of WHO-Classified Bleeding Events (WHO Bleeding Scale \geq 1) in the Overall Population

End point title	Incidence of WHO-Classified Bleeding Events (WHO Bleeding Scale \geq 1) in the Overall Population
-----------------	---

End point description:

Incidence of the World Health Organization (WHO)-classified bleeding events in the overall population. Analysis was performed on Full Analysis Set population that included all randomised subjects.

This secondary endpoint used the WHO-classified bleeding scale. Bleeding was the predominant clinical manifestation of ITP and was typically related to platelet count. Accordingly, measuring bleeding was important for monitoring this subject population. The WHO bleeding scale was neither specific to nor validated for ITP, but had been implemented in ITP clinical studies; no specific and validated tools for assessing bleeding in ITP were available.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Full study duration (31 Weeks)

Adverse event reporting additional description:

Treatment emergent adverse events are defined as adverse events starting on or after first administration of any study drug. Safety analyses were performed on the safety analysis set which included all subjects in the randomized population who received at least 1 dose or part of a dose of IMP. No deaths occurred during the study.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
09 September 2019	Amendment 1: The eligibility criteria were changed from 1 prior therapy to 2 prior therapies. The eligibility criteria were updated to specify highly effective methods of contraception per Clinical Trials Facilitation and Coordination Group recommendations (part of the Heads of Medicines Agencies). The conditions for (temporarily) withholding treatment, early discontinuation from the study, and early discontinuation from treatment were updated. The determination of the sample size, the primary endpoint analysis, and the key secondary endpoint analysis subject to alpha control were updated. A key secondary efficacy endpoint subject to alpha control was added. Japan-specific eligibility criteria were removed in lieu of a separate Japan-specific protocol.
18 September 2019	Amendment 2: The protocol was aligned with ICH E2A guideline and the categories of seriousness on the sponsor's SAE report form.
27 May 2020	Amendment 3: The postbaseline platelet count measurement was permitted within 1 day of the next procedure, for more flexibility. Fostamatinib was added as a permitted concurrent ITP medication upon its regulatory approval as ITP therapy. Eltrombopag was replaced with "oral thrombopoietin receptor agonist (TPO-RA)" to consider all TPO-RAs. An eligibility criterion was added regarding live/live-attenuated vaccines, as a preventive protection measure for participants. The key secondary endpoint analysis subject to alpha control and the determinations of sample size were updated to allow data from participants who met the definition of disease control during the study but who subsequently did not meet the criteria for disease control before the end of the treatment period, to contribute more data to the final estimate of the length of disease control. Derivation of pharmacokinetic parameters by noncompartmental methods became less appropriate with the limited pharmacokinetic sampling. Therefore, only efgartigimod serum concentration data were summarized. It was added to specify that IgG testing could not be performed locally to avoid unintentional unblinding. COVID-19 mitigation measures were added.
16 November 2020	Amendment 4: The eligibility criterion regarding the number of platelet counts at study entry was updated to allow more flexibility. Acceptable methods of contraception were added to the eligibility criteria per the results of the reproductive toxicity studies. The visit duration after the end of IMP infusions was shortened based on supporting safety data. The definition of AEs was updated and clarified. The definition of rescue therapy was updated to consist of an "occurrence," which was defined as a ≤ 5 -day period in which 1 or more rescue treatments were administered to a participant.
15 July 2021	Amendment 5: The primary endpoint analysis was updated. The key secondary endpoint analysis subject to alpha control was updated for consistency with the primary endpoint analysis.
19 July 2021	Country-Specific Amendment France version 5.1: The description of the 24-week treatment period (ie, "trial period") was updated to "treatment period" to clarify the duration of the period, per central IEC request. Clarifications in the protocol summary were added to state the number of visits and the time duration of each visit. Reference to the Summary of Product Characteristics was added to the Concurrent ITP Therapy section. The participant demographic assessment was modified to provide that source data verification of race and ethnicity should not be performed per French regulations.

20 July 2021	Country-Specific Amendment Japan version 5.1: The sample size for Japanese participants was added. The stratification and randomization strategy was updated for Japanese participants. Specific safety measures were added. The eligibility criteria were aligned with Japanese regulations: the minimum age of enrollment was changed to 20 years of age to align with Japanese age of majority, a definition of a Japanese participant was added, and a Helicobacter pylori test was added per current management of ITP in Japan.
