Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	25 February 2025
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	23 October 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess overall and intracranial response rate of single agent Lorlatinib in participants with advanced ALK positive NSCLC whose disease has progressed on alectinib or ceritinib as the first ALK tyrosine kinase inhibitor (TKI) therapy.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and in compliance with all International Council for Harmonization (ICH) Good Clinical Practice (GCP) guidelines. All the local regulatory requirements pertinent to safety of trials participants were followed.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	29 September 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Italy: 33
Country: Number of subjects enrolled	Spain: 18
Country: Number of subjects enrolled	India: 11
Country: Number of subjects enrolled	Poland: 3
Country: Number of subjects enrolled	Switzerland: 2
Country: Number of subjects enrolled	United Kingdom: 2
Country: Number of subjects enrolled	United States: 2
Worldwide total number of subjects	71
EEA total number of subjects	54

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	48
From 65 to 84 years	22
85 years and over	1

Subject disposition

Recruitment

Recruitment details:

A total of 71 participants were enrolled in the study.

Pre-assignment

Screening details:

Participants were enrolled at multiple sites, where study started from 29 September 2020 and completed on 23 October 2024.

Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Not applicable
Blinding used	Not blinded

Blinding implementation details:

There was no blinding.

Arms

Arm title	Lorlatinib
-----------	------------

Arm description:

Participants received Lorlatinib 100 milligrams (mg) (25 mg*4 tablets) orally once daily (QD) in 21-day cycles. Participants continued to receive study treatment until objective disease progression, unacceptable toxicity, participant refusal, lost to follow up or death, whichever occurred first.

Arm type	Experimental
Investigational medicinal product name	Lorlatinib
Investigational medicinal product code	PF-06463922
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Participants received Lorlatinib 100 mg orally once daily in 21-day cycle.

Number of subjects in period 1	Lorlatinib
Started	71
Completed	0
Not completed	71
Adverse event, serious fatal	9
Physician decision	2
Withdrawal by Participants	4
Global deterioration of health status	1
Adverse event, non-fatal	1
Entered Lorlatinib continuation Study	11
Switched to commercial Lorlatinib	13
Unspecified	3

Progressive disease	27

Reporting group title	Lorlatinib
Reporting group description: Participants received Lorlatinib 100 milligrams (mg) (25 mg*4 tablets) orally once daily (QD) in 21-day cycles. Participants continued to receive study treatment until objective disease progression, unacceptable toxicity, participant refusal, lost to follow up or death, whichever occurred first.	

Primary: Percentage of Participants With Confirmed Objective Response (OR) as per Independent Central Review (ICR) as Assessed by RECIST v1.1

End point title	Percentage of Participants With Confirmed Objective Response (OR) as per Independent Central Review (ICR) as Assessed by RECIST v1.1 ^[1]
-----------------	---

End point description:

Confirmed OR based on ICR assessment was defined as complete response (CR) or partial response (PR) according to response evaluation criteria in solid tumor (RECIST) version(v)1.1 from date of first dose until documented progressive disease(PD) or start of new anti-cancer therapy without regard to discontinuation from treatment. Both CR and PR must be confirmed by repeat assessments performed no less than 4 weeks after criteria for response are first met. CR: disappearance of all target and non-target(NT) lesions. PR: at least 30% decrease in sum of diameters of target, taking as reference baseline sum diameters. PD: at least 20% increase in sum of diameters of target lesions, taking as reference smallest sum on study. Appearance of one or more new lesions was also considered sign of progression. For non-target PD: unequivocal progression of existing non-target lesions. Intent to treat (ITT) analysis population included all enrolled participants who took at least 1 dose of Lorlatinib.

End point type	Primary
----------------	---------

End point timeframe:

From date of first dose until documented PD or start of new anti-cancer therapy, whichever occurred earlier (maximum treatment exposure up to 42.78 months)

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

End point title	Number of Participants With Maximum Grade 3 or 4 Treatment-Related AEs
-----------------	--

End point description:

An AE was any untoward medical occurrence in a participant or clinical study participant, temporally associated with use of study intervention, considered related to study intervention. An AE was considered treatment related if investigator considered event related to study drugs or the information was unknown. TEAEs were graded according to CTCAE v4.03 as grade 3= severe AE and grade 4= life threatening consequences. Safety analysis set included all enrolled participants who took at least 1 dose of study intervention.

End point type	Secondary
----------------	-----------

End point timeframe:

From first dose of the study treatment (Day 1) maximum up to 28-35 days after last dose of study drug or the new anti-cancer therapy date, whichever is earlier (maximum treatment exposure up to 43.78 months)

End point description:	
An AE was any untoward medical occurrence in participant or clinical study participant, temporally associated with use of study intervention, considered related to study intervention. A TEAE was defined as any event that occurs for first time during on-treatment period/ AEs that were observed prior to start of study treatment but increased in severity during on-treatment period (defined as time from first dose of study treatment through end of safety follow-up period, ie at least 28 days, and no more than 35 days after discontinuation of treatment, or start of new anti-cancer therapies [follow up systemic therapy, follow up radiation therapy or follow-up surgery], whichever occurs first). Adverse events occurring on same day as first dose of study treatment were also considered to have occurred during the on-treatment period. An AE was considered treatment related if investigator considered event related to study drugs/ information was unknown. Safety analysis set used.

End point title	Number of Participants With Treatment Emergent Serious Adverse Events (TESAEs)
-----------------	--

End point description:

A serious adverse event (SAE) was any untoward medical occurrence at any dose that: resulted in death; was life-threatening (immediate risk of death); required inpatient hospitalization or prolongation of existing hospitalization; resulted in persistent or significant disability/incapacity (substantial disruption of the ability to conduct normal life functions) or resulted in congenital anomaly/birth defect

or was considered an important medical event. TESAEs were defined as any event that occurs for first time during on-treatment period or SAEs that were observed prior to start of study treatment but increased in severity during on-treatment period (defined as time from first dose of study treatment through end of safety follow-up period, ie at least 28 days, and no more than 35 days after discontinuation of treatment, or start of new anti-cancer therapies, whichever occurs first). Adverse events

Adverse events information

Timeframe for reporting adverse events:

From first dose of the study treatment (Day 1) maximum up to 28-35 days after last dose of study drug or the new anti-cancer therapy date, whichever was earlier (maximum treatment exposure up to 43.78 months)

Adverse event reporting additional description:

Safety analysis set. Same event may appear as both non-SAE & SAE. Presented are distinct events.

Event may be categorized: serious in 1 participant and non-serious in other/may have experienced both SAE & non-SAE.

Assessment type	Non-systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
01 September 2022	Permitted participants meeting criteria who continued to experience clinical benefit from the study intervention to continue therapy after disease progression and to provide clarity around reasons for discontinuation of study intervention.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
