Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 February 2022
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	04 February 2022
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objective of the trial was to compare the efficacy of vortioxetine versus desvenlafaxine after 8 weeks of treatment, on depressive symptoms in participants with major depressive disorder (MDD) who have responded partially to monotherapy with a selective serotonin reuptake inhibitor (SSRI).

Protection of trial subjects:

This study was conducted in compliance with Good Clinical Practice and in accordance with the ethical principles described in the Declaration of Helsinki.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	18 June 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Notes:

Subjects enrolled per age group

In utero	0
----------	---

Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	598
From 65 to 84 years	7
85 years and over	0

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

605 participants were enrolled in the study. 603 participants received at least one dose of study treatment.

Period 1

Period 1 title	Overall study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Vortioxetine

Arm description:

Participants received 10 milligrams (mg) vortioxetine once daily for the first week. At the end of Week 1 (Day 7), the dose was increased to 20mg/day. The dose may have been adjusted (10 or 20mg/day) at unscheduled visits or at the end of Week 4 (Day 28) (only once) based on the participant's response and the investigator's clinical judgement. No dose changes were permitted after Week 4. The dose remained fixed until the end of the treatment period (Week 8, Day 56). From Week 8, participants received placebo once daily for one week.

Arm type	Experimental
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Placebo was administered per dose and schedule specified in the arm description.

Investigational medicinal product name	Vortioxetine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Vortioxetine was administered per dose and schedule specified in the arm description.

Arm title	Desvenlafaxine
------------------	----------------

Arm description:

Participants received a fixed dose of 50mg once daily during the treatment period. In order to maintain the blind, a dose adjustment could have been requested based on the participant's response and the investigator's clinical judgement, however, the dose of desvenlafaxine remained fixed. From Week 8, participants received 50mg desvenlafaxine or placebo every other day for one week.

Arm type	Active comparator
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Placebo was administered per dose and schedule specified in the arm description.

Investigational medicinal product name	Desvenlafaxine
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule
Routes of administration	Oral use

Dosage and administration details:

Desvenlafaxine was administered per dose and schedule specified in the arm description.

Number of subjects in period 1	Vortioxetine	Desvenlafaxine
Started	312	293
Received at least 1 dose of study drug	310	293
Completed	295	284
Not completed	17	9
Consent withdrawn by subject	5	3
Adverse event, non-fatal	6	3
Not specified	2	2
Lost to follow-up	1	-
Lack of efficacy	1	1
Not treated	2	-

Montgomery and Åsberg Depression Rating Scale (MADRS) Total Score			
The MADRS is a 10-item rating scale designed to assess the severity of the symptoms in depressive illness and to be sensitive to treatment effects. Items in the scale assess apparent sadness, reported sadness, inner tension, reduced sleep, reduced appetite, concentration difficulties, lassitude, inability to feel, pessimistic thoughts, and suicidal thoughts. The total score of the 10 items ranges from 0 (no symptoms) to 60 (severe symptoms), with higher scores indicating more severe symptoms. Participants with valid baseline scores are presented here (Vortioxetine n=309; Desvenlafaxine n=293)

Secondary: Change from Baseline in Digital Symbol Substitution Test (DSST) Total Score to Week 8

End point title	Change from Baseline in Digital Symbol Substitution Test (DSST) Total Score to Week 8
-----------------	---

End point description:

The DSST is a cognitive test designed to assess psychomotor speed of performance requiring visual perception, spatial decision-making, and motor skills. The DSST is sensitive to cognitive impairments affecting attention, processing speed, and executive function (including working memory). The DSST consists of 133 digits and requires the participant to substitute each digit with a simple symbol in a 90-second period. Each correct symbol is counted, and the total score ranges from 0 (less than normal functioning) to 133 (greater than normal functioning).

Analysis was performed on the FAS – all randomized participants who took at least 1 dose of double-blind study drug and had a valid baseline and at least 1 valid post-baseline assessment of the primary efficacy variable (MADRS). Secondary: Participant's Probability of Choosing Hard Task For Each Effort Expenditure for Rewards Task (EEfRT) Trial at Week 8

End point title	Participant's Probability of Choosing Hard Task For Each Effort Expenditure for Rewards Task (EEfRT) Trial at Week 8
-----------------	--

End point description:

The EEfRT is a neuropsychological task to assess willingness to make efforts to obtain a monetary reward under different conditions of reward probability and magnitude. The participant is given an opportunity to choose between two tasks with different levels of difficulty: a "hard task" and an "easy task" option, which require different amounts of repeated manual button pressing. For easy-task choices, the participant is eligible to win a fixed amount of monetary reward on each trial if he/she successfully completes the task. For hard-task choices, the participant is eligible to win higher amounts that vary per trial within a range ("reward magnitude").

Analysis was performed on the FAS – all randomized participants who took at least 1 dose of double-blind study drug and had a valid baseline and at least 1 valid post-baseline assessment of the primary efficacy variable (MADRS). Here, 'number of subjects analyzed' signifies participants evaluable for this endpoint.

-----------------------	----------------

Reporting group description:

Participants received a fixed dose of 50mg once daily during the treatment period. In order to maintain the blind, a dose adjustment could have been requested based on the participant's response and the investigator's clinical judgement, however, the dose of desvenlafaxine remained fixed. From Week 8, participants received 50mg desvenlafaxine or placebo every other day for one week.

Reporting group title	Vortioxetine
-----------------------	--------------

Reporting group description:

Participants received 10 milligrams (mg) vortioxetine once daily for the first week. At the end of Week 1 (Day 7), the dose was increased to 20mg/day. The dose may have been adjusted (10 or 20mg/day) at unscheduled visits or at the end of Week 4 (Day 28) (only once) based on the participant's response and the investigator's clinical judgement. No dose changes were permitted after Week 4. The dose remained fixed until the end of the treatment period (Week 8, Day 56). From Week 8, participants received placebo once daily for one week.

Serious adverse events	Desvenlafaxine	Vortioxetine	
Total subjects affected by serious adverse events			
subjects affected / exposed	1 / 293 (0.34%)	0 / 310 (0.00%)	
number of deaths (all causes)	0	0	
number of deaths resulting from adverse events	0	0	
Gastrointestinal disorders			
Vomiting			
subjects affected / exposed	1 / 293 (0.34%)	0 / 310 (0.00%)	
occurrences causally related to treatment / all	0 / 1	0 / 0	
deaths causally related to treatment / all	0 / 0	0 / 0	

Frequency threshold for reporting non-serious adverse events: 5 %

Non-serious adverse events	Desvenlafaxine	Vortioxetine	
Total subjects affected by non-serious adverse events			
subjects affected / exposed	61 / 293 (20.82%)	85 / 310 (27.42%)	
Nervous system disorders			

Headache			
subjects affected / exposed	25 / 293 (8.53%)	30 / 310 (9.68%)	
occurrences (all)	29	34	
Dizziness			
subjects affected / exposed	16 / 293 (5.46%)	16 / 310 (5.16%)	
occurrences (all)	18	16	
Gastrointestinal disorders			
Nausea			
subjects affected / exposed	27 / 293 (9.22%)	62 / 310 (20.00%)	
occurrences (all)	29	75	

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
