General information about the trial

Main objective of the trial:

The primary objective of this study was to investigate the effect of K-321 dosed for 12 weeks on central ECD in patients with FECD after descemetorhexis.

Protection of trial subjects:

The study was conducted in accordance with the World Medical Association Declaration of Helsinki; ICH GCP; General Data Protection Regulation or Directive 2001/20/EC (in the EU); the FDA GCP, as described in 21 CFR Parts 11, 50, 54, 56, and 312 and Health Insurance Portability and Accountability Act (in the US); and the laws and regulations of the country where the study was conducted. Prior to the initiation of any study procedures, each patient signed and dated an approved informed consent form. Each patient was assured of his/her right to withdraw from the study at any time.

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

After obtaining informed consent at Visit 1, the patient returned for the descemetorhexis operation and randomly assigned to treatment after 1 to 4 weeks (Visit 2). At Visit 2, each patient's eligibility for study participation was confirmed, which included the requirement of a successful descemetorhexis operation.
