General information about the trial

Main objective of the trial:

To demonstrate the superiority of finerenone to placebo in reducing the rate of the composite CV endpoint of CV death and total heart failure (HF) events in HF patients (LVEF $\geq 40\%$).

Protection of trial subjects:

The conduct of this clinical study met all local legal and regulatory requirements. The study was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and the International Conference on Harmonization guideline E6: Good Clinical Practice (GCP). Before entering the study, the informed consent form was read by and explained to all subjects and/or their legally authorized representative. Participating subjects and/or their legally authorized representative signed informed consent form and could withdraw from the study at any time without any disadvantage and without having to provide a reason for this decision. Only investigators qualified by training and experience were selected as appropriate experts to investigate the study drug.

Recruitment

Recruitment details:

Study was conducted at multiple centers in 37 countries/regions between 14-Sep-2020 (first participant first visit) and 14-Jun-2024 (last participant last visit).

Pre-assignment

Screening details:

Of the 7463 screened participants, 1447 were screening failures, 6016 were randomized. Of the 3011 participants randomized into the finerenone group and the 3005 into the placebo group, 8 and 7 participants respectively were prospectively excluded from analysis due to major GCP violations.

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
21 September 2020	addressed requests from health authorities
16 May 2022	altered certain secondary efficacy endpoints of the study: • The secondary efficacy variable on sustained eGFR decrease was changed from $\geq 40\%$ to $\geq 50\%$ based on data from the FIGARO-DKD and FIDELIO-DKD studies. • Change in NYHA class from baseline was removed from exploratory endpoints. Total HF events and improvement in NYHA class from baseline to Month 12 were added as secondary endpoints due to their clinical significance. • Change in UACR from baseline and time to first occurrence of the following composite endpoint: sustained decrease in eGFR $\geq 57\%$ relative to baseline over at least 4 weeks, or sustained eGFR decline to <15 mL/min/1.73 m ² or initiation of dialysis or renal transplantation, were added as exploratory endpoints to compare the results with existing data from FIGARO-DKD and FIDELIO-DKD.
