

Clinical trial results:

A 26-week trial comparing the effect and safety of once weekly insulin icodec and once daily insulin degludec, both with or without non-insulin anti-diabetic drugs, in subjects with type 2 diabetes treated with basal insulin

| Global end of trial reached? | Yes |
| Global end of trial date | 01 March 2022 |
| Was the trial ended prematurely? | No |

Notes:

General information about the trial

Main objective of the trial:

The main objective of the trial was to demonstrate the effect on glycaemic control of once weekly insulin icodec, with or without non-insulin anti-diabetic drugs, in subjects with type 2 diabetes (T2D) treated with basal insulin.

Protection of trial subjects:

The trial was conducted in accordance with the Declaration of Helsinki (64th World Medical Association (WMA) general Assembly; Oct 2013) and International Council for Harmonisation (ICH) Good Clinical Practice, including archiving of essential documents (Current Step 4 version, Nov 2016), and 21 Code of Federal Regulations (CFR) 312.120.

Background therapy:

After randomisation subjects continued their pre-trial non-insulin anti-diabetic background medication throughout the entire trial except from sulfonylureas and glinides, which had to be discontinued at randomisation.

Evidence for comparator: -

| | |
|---|---------------|
| Actual start date of recruitment | 05 March 2021 |
| Long term follow-up planned | No |
| Independent data monitoring committee (IDMC) involvement? | No |

Notes:

Population of trial subjects

Subjects enrolled per country

| | |
|--------------------------------------|--|
| Country: Number of subjects enrolled | Bulgaria: 33 |
| Country: Number of subjects enrolled | Germany: 45 |
| Country: Number of subjects enrolled | Japan: 100 |
| Country: Number of subjects enrolled | Korea, Democratic People's Republic of: 70 |
| Country: Number of subjects enrolled | Poland: 30 |
| Country: Number of subjects enrolled | Portugal: 29 |
| Country: Number of subjects enrolled | South Africa: 50 |
| Country: Number of subjects enrolled | Ukraine: 30 |
| Country: Number of subjects enrolled | United States: 139 |
| Worldwide total number of subjects | 526 |
| EEA total number of subjects | 137 |

Notes:

| Subjects enrolled per age group | |
|---|-----|
| In utero | 0 |
| Preterm newborn - gestational age < 37 wk | 0 |
| Newborns (0-27 days) | 0 |
| Infants and toddlers (28 days-23 months) | 0 |
| Children (2-11 years) | 0 |
| Adolescents (12-17 years) | 0 |
| Adults (18-64 years) | 294 |
| From 65 to 84 years | 232 |
| 85 years and over | 0 |

Subject disposition

Recruitment

Recruitment details:

The trial was conducted at 71 sites in 9 countries as follows: United States of America (USA) (26), Ukraine (4), Portugal (6), Poland (3), Republic of Korea (7), Japan (9), Germany (6), Bulgaria (4), South Africa (6).

Pre-assignment

Screening details:

After randomisation subjects continued their pre-trial non-insulin anti-diabetic background medication throughout the entire trial except from sulfonylureas and glinides, which had to be discontinued at randomisation.

Period 1

| | |
|------------------------------|--------------------------------|
| Period 1 title | Overall study (overall period) |
| Is this the baseline period? | Yes |
| Allocation method | Randomised - controlled |
| Blinding used | Not blinded |

Arms

| | |
|------------------------------|----------------|
| Are arms mutually exclusive? | Yes |
| Arm title | Insulin Icodec |

Arm description:

Subjects were to receive once weekly subcutaneous (s.c.) injection of Insulin icodec for 26 weeks, using PDS290 prefilled pen-injector at a starting dose of 7 times the pre-trial total daily basal insulin dose + 50% of their 7 times total daily basal insulin dose. The following weekly dose was 7 times the total daily dose of the respective subjects ('unit to unit switch' approach: current daily dose x 7). Subjects were to perform once daily pre-breakfast self-monitoring plasma glucose (SMPG). The dose was adjusted based on 3 pre-breakfast SMPG values measured on the 2 previous days and the day of the contact. If at least one pre-breakfast SMPG value was: < 4.4 millimoles per liter (mmol/L): dose reduced by 3 units (U); 4.4-7.2 mmol/L: no adjustment; > 7.2 mmol/L: dose increased by 3 U.

| | |
|--|--------------------------------|
| Arm type | Experimental |
| Investigational medicinal product name | Insulin icodec 700 U/mL PDS290 |
| Investigational medicinal product code | |
| Other name | |
| Pharmaceutical forms | Solution for injection |
| Routes of administration | Subcutaneous use |

Dosage and administration details:

Insulin icodec was administered once-weekly subcutaneously at a dose strength of 700 units/ milliliter (mL).

| | |
|------------------|------------------|
| Arm title | Insulin degludec |
|------------------|------------------|

Arm description:

Subjects were to receive once daily s.c. injection of Insulin degludec for 26 weeks, using PDS290 prefilled pen-injector at a dose in accordance with local label. Subjects were to perform once daily SMPG. The dose was adjusted based on 3 pre-breakfast SMPG values measured on the 2 previous days and the day of the contact. If at least one pre-breakfast SMPG value was: < 4.4 mmol/L: dose reduced by 20 U; 4.4-7.2 mmol/L: no adjustment; > 7.2 mmol/L: dose increased by 20 U.

| | |
|--|------------------------|
| Arm type | Experimental |
| Investigational medicinal product name | Tresiba 100 units/mL |
| Investigational medicinal product code | |
| Other name | |
| Pharmaceutical forms | Solution for injection |
| Routes of administration | Subcutaneous use |

Dosage and administration details:

Insulin degludec was administered once daily subcutaneously at a dose strength of 100 units/mL.

| Number of subjects in period 1 | Insulin Icodec | Insulin degludec |

Statistical analyses

| | |
|---|----------------------------|
| Statistical analysis title | Statistical Analysis Set 1 |
| Statistical analysis description: The response and change from baseline in response after 26 weeks were analysed using an analysis of covariance (ANCOVA) model with treatment, region and personal continuous glucose monitoring (CGM) device use as fixed factors, and baseline response as covariate. | |

| | |
|---|-----------------------------------|
| Comparison groups | Insulin Icodec v Insulin degludec |
| Number of subjects included in analysis | 526 |
| Analysis specification | Pre-specified |
| Analysis type | non-inferiority ^[1] |
| P-value | < 0.0001 |
| Method | ANCOVA |
| Parameter estimate | Treatment difference |
| Point estimate | -0.22 |
| Confidence interval | |
| level | 95 % |
| sides | 2-sided |
| lower limit | -0.37 |
| upper limit | -0.08 |

Notes:

[1] - Non-inferiority of insulin icodec was considered confirmed if the upper limit of the two-sided 95% confidence interval (CI) for mean treatment difference (insulin icodec minus insulin degludec) was strictly below 0.3%.

Secondary: Change in fasting plasma glucose (FPG)

Secondary: Change in DTSQs (Diabetes Treatment Satisfaction Questionnaire) in total treatment satisfaction

| | |
|-----------------|---|
| End point title | Change in DTSQs (Diabetes Treatment Satisfaction Questionnaire) in total treatment satisfaction |
|-----------------|---|

End point description:

Change in DTSQs in total treatment satisfaction is presented. The DTSQ domain score was calculated by adding six item scores of items 1 and 4-8. Higher scores indicate higher levels of treatment satisfaction for items 1, 4 -8. For items 2 and 3, a higher score indicates a subject perceived experience of hyperglycaemia and hypoglycaemia. Lower scores indicate that blood glucose levels were unacceptably high (item 2) or low (item 3). The score has a minimum of 0 and a maximum of 36. The endpoint data was evaluated based on in-trial observation period. The period started at randomisation and ended at the date of: Last direct subject-site contact, withdrawal for subjects who withdrew their informed consent, Last subject-investigator contact as defined by investigator for subjects who were lost to follow-up and death for subjects who died before any of the above. FAS included all randomised subjects. Number of subjects analysed=subjects with available data for this endpoint.

End point description:

Change in body weight from baseline week 0 (V2) to week 26 (V28) is presented. The endpoint data was evaluated based on the in-trial observation period. In-trial observation period started at randomisation and ended at the date of: The last direct subject-site contact, withdrawal for subjects who withdrew their informed consent, the last subject-investigator contact as defined by the investigator for subjects who were lost to follow-up (i.e., possibly an unscheduled phone visit) and death for subjects who died before any of the above. Full analysis set included all randomised subjects.

Secondary: Mean weekly insulin dose

| | |
|-----------------|--------------------------|
| End point title | Mean weekly insulin dose |
|-----------------|--------------------------|

End point description:

Mean weekly insulin dose is presented. The endpoint data was evaluated based on the on-treatment observation period. The on-treatment period started at the date of first dose of trial product as recorded on the electronic case report form (eCRF), and ended at the first date of any of the following: The end of trial visit (V30), the last date on trial product + 5 weeks for once daily insulin and + 6 weeks for once weekly insulin (corresponding to 5 weeks after the end of the dosing interval for both treatment arms) and the end-date for the in-trial observation period. The on-treatment period represented the time period in which a subject was considered exposed to trial product. FAS included all randomised subjects.

| | |

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From baseline (Week 0) to Week 31

Adverse event reporting additional description:

Safety analysis set included all randomised subjects who were randomly assigned to trial treatment and who took at least 1 dose of trial product. A treatment-emergent AE (TEAE) was defined as an AE that initiated or worsened on or after the date of first dose of study drug up to the end of trial (week 31). All presented AEs are treatment emergent.

Reporting groups

| | |
|-----------------------|------------------|
| Reporting group title | Insulin Degludec |
|-----------------------|------------------|

Reporting group description:

Subjects were to receive once daily s.c. injection of Insulin degludec for 26 weeks, using PDS290 prefilled pen-injector at a dose in accordance with local label. Subjects were to perform once daily SMPG. The dose was adjusted based on 3 pre-breakfast SMPG values measured on the 2 previous days and the day of the contact. If at least one pre-breakfast SMPG value was: < 4.4 mmol/L: dose reduced by 20 U; 4.4-7.2 mmol/L: no adjustment; > 7.2 mmol/L: dose increased by 20 U.

| | |
|-----------------------|----------------|
| Reporting group title | Insulin Icodec |
|-----------------------|----------------|

Reporting group description:

Subjects were to receive once weekly subcutaneous (s.c.) injection of Insulin icodec for 26 weeks, using PDS290 prefilled pen-injector at a starting dose of 7 times the pre-trial total daily basal insulin dose + 50% of their 7 times total daily basal insulin dose. The following weekly dose was 7 times the total daily dose of the respective subjects ('unit to unit switch' approach: current daily dose x 7). Subjects were to perform once daily pre-breakfast self-monitoring plasma glucose (SMPG). The dose was adjusted based on 3 pre-breakfast SMPG values measured on the 2 previous days and the day of the contact. If at least one pre-breakfast SMPG value was: < 4.4 millimoles per liter (mmol/L): dose reduced by 3 units (U); 4.4-7.2 mmol/L: no adjustment; > 7.2 mmol/L: dose increased by 3 U.
