

Clinical trial results:

A Phase 3, randomized, double-blind efficacy and safety study comparing SAR442168 to teriflunomide (Aubagio®) in participants with relapsing forms of multiple sclerosis (GEMINI 1)

Summary

EudraCT number	2020-000637-41
Trial protocol	DE BG CZ FI SE AT DK LT PL IT RO
Global end of trial date	15 July 2024

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 August 2024
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	15 July 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To assess efficacy of daily tolebrutinib compared to a daily dose of 14 milligrams (mg) teriflunomide (Aubagio) measured by the annualized adjudicated relapse rate (ARR) in participants with relapsing forms of multiple sclerosis (MS).

Protection of trial subjects:

Participants were fully informed of all pertinent aspects of the clinical trial as well as the possibility to discontinue at any time in language and terms appropriate for the participant and considering the local culture. During the course of the trial, participants were provided with individual participant cards indicating the nature of the trial the participant is participating, contact details and any information needed in the event of a medical emergency.

Collected personal data and human biological samples were processed in compliance with the Sanofi-Aventis Group Personal Data Protection Charter ensuring that the Group abides by the laws governing personal data protection in force in all countries in which it operates.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	30 June 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Worldwide total number of subjects	974
EEA total number of subjects	417

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	974
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

A total of 1152 participants were screened from 30-Jun-2020 to 04-Aug-2022, of which 178 were screen failures. Screen failures were mainly due to not meeting eligibility criteria.

Pre-assignment

Screening details:

A total of 974 participants were randomized in this study in a 1:1 ratio to either teriflunomide 14 mg or tolebrutinib 60 mg group. This was an event-driven (6-month confirmed disability worsening [CDW]) trial with a variable treatment duration (end-of-study [EOS] duration: up to approximately 48 months).

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Teriflunomide 14 mg

Arm description:

Participants received teriflunomide 14 mg tablet orally once daily (QD) along with a placebo matched to tolebrutinib orally QD up to approximately 47 months.

Arm type	Active comparator
Investigational medicinal product name	Teriflunomide
Investigational medicinal product code	
Other name	Aubagio
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Teriflunomide 14 mg was administered as a tablet orally QD up to approximately 47 months.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo matched to tolebrutinib was administered as a tablet orally QD up to approximately 47 months.

Arm title	Tolebrutinib 60 mg
------------------	--------------------

Arm description:

Participants received tolebrutinib 60 mg tablet orally QD along with a placebo matched to teriflunomide orally QD up to approximately 48 months.

Arm type	Experimental
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Placebo matched to teriflunomide was administered as a tablet orally QD up to approximately 48

months.

Investigational medicinal product name	Tolebrutinib
Investigational medicinal product code	SAR442168
Other name	
Pharmaceutical forms	Film-coated tablet
Routes of administration	Oral use

Dosage and administration details:

Tolebrutinib 60 mg was administered as a tablet orally QD up to approximately 48 months.

Number of subjects in period 1	Teriflunomide 14 mg	Tolebrutinib 60 mg
Started	488	486
Completed	415	409
Not completed	73	77
Consent withdrawn by subject	64	66
Poor compliance to protocol	2	4
Unspecified	6	7
Missing study status	1	-

Reporting group title	Tolebrutinib 60 mg
Reporting group description: Participants received tolebrutinib 60 mg tablet orally QD along with a placebo matched to teriflunomide orally QD up to approximately 48 months.	

Primary: Annualized Relapse Rate as Assessed by Confirmed Protocol-defined Adjudicated Relapses

End point title	Annualized Relapse Rate as Assessed by Confirmed Protocol-defined Adjudicated Relapses
End point description: The MS relapse was defined as a monophasic, acute or subacute onset of new neurological symptoms or worsening of previous neurological symptoms with an objective change on neurological examination. Symptoms were attributable to MS, lasted for ≥ 24 hours with or without recovery, present at normal body temperature, and preceded by ≥ 30 days of clinical stability. The intent-to-treat (ITT) population included all randomized participants according to the intervention group allocated by the randomization, irrespective of the study intervention received.	
End point type	Primary
End point timeframe: Baseline (Day 1) to approximately 48 months	

End point values	Teriflunomide 14 mg	Tolebrutinib 60 mg		
Subject group type	Reporting group	Reporting group		
Number of subjects analysed	488	486		
Units: relapses per participant year				
number (confidence interval 95%)	0.122 (0.100 to 0.150)	0.130 (0.108 to 0.156)		

Statistical analyses

Statistical analysis title	Annualized Relapse Rate
Statistical analysis description: Analysis was performed using negative binomial model with number of adjudicated relapses onset between randomization date and EOS date as the response variable, treatment group, Gadolinium (Gd)-enhancing T1 lesions at baseline (presence, absence), expanded disability status scale (EDSS) strata (<4 , ≥ 4) and geographic region (United States [US], non-US) as covariates, and log transformed observation duration as the offset variable.	
Comparison groups	Teriflunomide 14 mg v Tolebrutinib 60 mg

Number of subjects included in analysis	974
Analysis specification	Pre-specified
Analysis type	superiority ^[1]
P-value	= 0.6691 ^[2]
Method	Chi-squared
Parameter estimate	Relative risk
Point estimate	1.061
Confidence interval	
level	95 %
sides	2-sided
lower limit	0.808
upper limit	1.393

Notes:

[1] - A hierarchical testing procedure was used to control the overall type I error.

[2] - Threshold for significance at 2-sided 0.05 level.

Secondary: Time to Onset of 6-Month Confirmed Disability Worsening as Assessed by Expanded Disability Status Scale

End point title	Time to Onset of 6-Month Confirmed Disability Worsening as Assessed by Expanded Disability Status Scale
-----------------	---

End point description:

The EDSS was a disability scale that assessed the following 7 functional domains: visual, brainstem, pyramidal [motor], cerebellar [coordination], sensory, cerebral, and bowel/bladder. The total EDSS score ranged from 0 (normal) to 10 (death due to MS), increasing in increments of 0.5 points. Higher scores indicated increased disability. Time to onset of 6-month CDW was defined as the time from randomization to the onset of a confirmed, sustained increase from baseline in EDSS score (of ≥ 1.5 points when the baseline score was 0, of ≥ 1.0 point when the baseline score was 0.5 to ≤ 5.5 , of ≥ 0.5 points when the baseline EDSS score was > 5.5) over at least 6 months that was not attributable to another etiology. The ITT population included all randomized participants according to the intervention group allocated by the randomization, irrespective of the study intervention received.

Secondary: Change From Baseline in Cognitive Function as Assessed by the Symbol Digit Modalities Test (SDMT) at EOS

End point title	Change From Baseline in Cognitive Function as Assessed by the Symbol Digit Modalities Test (SDMT) at EOS
-----------------	--

End point description:

The SDMT was used to assess processing speed, divided attention, visual scanning, tracking and motor speed. It involved a simple substitution task using a reference key. The number of correct substitutions and number of items completed within a 90 second interval (maximum 110 seconds) were recorded. A decrease of 4 points from baseline on the SDMT was considered meaningful worsening. The score was the number of correctly coded items from 0-110 in 90 seconds; higher scores indicating a better outcome. Baseline was defined as the last available value prior to the first dose of study intervention. Analysis was performed on the ITT population. Only participants with data collected at specified timepoints are reported.

MSQoL-54 consisted of 12 subscales & 2 single-item measures(satisfaction with sexual function[1 item]; change in health[1 item]).12 subscales were:a:physical health(10 items), b:health perceptions(5 items), c:energy(5 items), d:role limit physical(4 items), e:sexual function(4 items), f:pain(3 items), g:social function(3 items), h:health distress(4 items), i:overall quality of life(2 items), j:emotional well-being(5 items), k:role limitations emotional(3 items) and l:cognitive function(4 items).Physical & mental health composite score were calculated as weighted sum of 'a to h' & 'i to l' subscales respectively. Each composite score was transformed linearly to common 0(worst) to 100(best) score range;higher score indicated improved QoL. Baseline=last available value prior to first dose of study intervention.Analysis was performed on ITT population.Only participants with data collected at specified timepoints are reported. n=number of participants analyzed for each specified category.

(TEAEs), Treatment-emergent Serious Adverse Events (TESAEs), TEAEs Leading to Permanent Study Intervention Discontinuation and Treatment-emergent Adverse Events of Special Interest (AESIs)

End point title	Number of Participants With Treatment-emergent Adverse Events (TEAEs), Treatment-emergent Serious Adverse Events (TESAEs), TEAEs Leading to Permanent Study Intervention Discontinuation and Treatment-emergent Adverse Events of Special Interest (AESIs)
-----------------	--

End point description:

An AE was any untoward medical occurrence in a participant or clinical study participant, temporally associated with the use of study intervention, whether or not considered related to the study intervention. SAE was any untoward medical occurrence that at any dose: resulted in death, was life-threatening, required inpatient hospitalization or prolongation of existing hospitalization, resulted in persistent disability/incapacity, was a congenital anomaly/birth defect or was an important medical event. An AESI was an AE (serious or nonserious) of scientific and medical concern specific to the Sponsor's product or program for which ongoing monitoring and immediate notification by the Investigator to the Sponsor was required. TEAEs were defined as AEs that developed, worsened or became serious during the TE period. Safety population included all randomized participants exposed to study intervention, regardless of amount of exposure, analyzed according to intervention actually received.

End point type	Secondary

Adverse events

Adverse events information

Timeframe for reporting adverse events:

From first dose of study intervention (Day 1) up to the earliest of either 10 days post last dose, death or last contact; up to approximately 48 months. Deaths were collected from baseline (Day 1) up to end of follow-up, approximately 48 months.

Adverse event reporting additional description:

Analysis was performed on the safety population. This was an event-driven (6-month CDW) trial with a variable treatment duration (EOS duration: up to approximately 48 months).

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
07 May 2020	The purpose of the amendment was to add exclusion criteria that were previously omitted and to meet the regulatory requirement of a benefit/risk evaluation of the study in the context of the Coronavirus Disease 2019 pandemic.
24 August 2020	The purpose of the amendment was to respond to European Health Authorities' requests.
28 September 2020	The purpose of the amendment was to respond to Japanese Health Authorities' requests.
14 April 2021	The purpose of the amendment was to update the liver function test frequency in the European Union countries in accordance with the updated teriflunomide (Aubagio) summary of product characteristics. Alanine aminotransferase (ALT) exclusion criterion was also updated to align with the Aubagio label.
18 November 2021	The purpose of the amendment was to update the safety follow-up algorithms for ALT increase and thrombocytopenia and the platelet level threshold for definition of an AESI in order to harmonize them with the other studies in the Phase 3 program.
24 May 2022	The purpose of the amendment was to update liver related exclusion criteria and monitoring to mitigate risk of drug-induced liver injury (DILI).
13 September 2022	The purpose of the amendment was to further reduce the risk of DILI by increasing the intensity of liver monitoring.
12 December 2022	The purpose of the amendment was to clarify information about DILI and update the ALT increase algorithm in relation to the risk of DILI.
17 November 2023	The purpose of the amendment was to update the testing requirements in the "Increase in ALT algorithm" and update the country-specific requirements for Japan with additional guidelines in case of ALT increase >3 x upper limit of normal as per Health Authorities requests.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
