

Clinical trial results:

A Randomized, Double-blind, Placebo-controlled, Multicenter, Proof-of-concept Study to Evaluate a Combined Oral Contraceptive (COC) Containing 30 µg Ethinylestradiol and 150 µg Levonorgestrel Plus 50 mg Dehydroepiandrosterone (DHEA) or Placebo to Counteract Distressing Decreased Sexual Desire Secondary to COC Use

Summary

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	10 July 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	10 July 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of DHEA (50 mg daily dose) relative to placebo in women with COC-associated distressing loss of sexual desire (Hypoactive Sexual Desire Disorder (HSDD) secondary to COC use) as measured by Profile of Female Sexual Function (PFSF) Desire domain.

Protection of trial subjects:

This study was conducted in accordance with current applicable regulations, International Conference on Harmonisation (ICH) guidelines, and local legal requirements. It complies with the ethical principles described in the 18th World Medical Assembly declaration (Declaration of Helsinki, 1964) and amendments of the 29th (Tokyo 1975), 35th (Venice 1983), 41st (Hong Kong 1989) and 48th (South Africa 1996) World Medical Assemblies, to the Declaration of Helsinki.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	02 November 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 277
Country: Number of subjects enrolled	Romania: 46
Country: Number of subjects enrolled	Bulgaria: 27
Country: Number of subjects enrolled	Czechia: 22
Country: Number of subjects enrolled	Hungary: 25
Worldwide total number of subjects	397
EEA total number of subjects	397

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	397
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This study was conducted at 51 sites in Europe and consisted of a 9-week pretreatment period, a 12-week open-label treatment period (Treatment Period 1), a second 12-week double-blind treatment period (Treatment Period 2), and a 1-week follow-up period.

Pre-assignment

Screening details:

A total of 662 participants were screened of whom 397 enrolled and were treated in Treatment Period 1. A total of 168 qualifying participants continued to Treatment Period 2 and were randomized to double-blind DHEA 50 mg or placebo in a 1:1 ratio.

Period 1

Period 1 title	Treatment Period 1
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Arm title	Combined oral contraceptives (COC)
------------------	------------------------------------

Arm description:

One COC tablet containing 30 µg ethinylestradiol (EE) and 150 µg levonorgestrel (LNG) was taken orally, once daily, for 21 consecutive days, followed by a 7-day tablet-free interval from Day 22 to Day 28 of each cycle. This 28-day cyclic regimen was taken for 3 cycles in Treatment Period 1.

Arm type	Experimental
Investigational medicinal product name	COC tablet
Investigational medicinal product code	
Other name	(Oestrogen) Ethinylestradiol and (Progestogen) Levonorgestrel
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Taken once daily by mouth, in the morning, and at the same time each day in the order directed on the blister package.

Number of subjects in period 1	Combined oral contraceptives (COC)
Started	397
Completed	289
Not completed	108
Physician decision	7
Consent withdrawn by subject	36
Adverse event, non-fatal	19
Not specified	42
Lost to follow-up	4

Period 2

Period 2 title	Treatment Period 2
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	DHEA 50 mg + COC

Arm description:

Eligible participants who completed Treatment Period 1 and qualified at the second baseline (Visit 8) continued to receive COC treatment and were randomized to also receive DHEA during Treatment Period 2. In the second treatment period, one COC tablet containing 30 µg EE and 150 µg LNG was taken on Days 1 to 21, and two 25 mg DHEA tablets were taken on Days 1 to 28 of each 28-day cycle. COC + DHEA were taken together, once daily, in the morning, and with a meal. This 28-day cyclic regimen was to be taken for 3 consecutive cycles.

Arm type	Experimental
Investigational medicinal product name	Prasterone
Investigational medicinal product code	
Other name	Dehydroepiandrosterone (DHEA)
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

One tablet of combined 30 µg EE/150 µg LNG and two 25 mg DHEA/placebo tablets were to be taken together once daily, in the morning, with a meal.

Investigational medicinal product name	COC tablet
Investigational medicinal product code	
Other name	(Oestrogen) Ethinylestradiol and (Progestogen) Levonorgestrel
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Taken once daily by mouth, in the morning, and at the same time each day in the order directed on the blister package.

Arm title	Placebo + COC
------------------	---------------

Arm description:

Eligible participants who completed Treatment Period 1 and qualified at the second baseline (Visit 8) continued to receive COC treatment and were randomized to also receive placebo during Treatment Period 2. One COC tablet containing 30 µg EE and 150 µg LNG was taken on Days 1 to 21 of each cycle and two matching placebo (DHEA) tablets were taken on Days 1 to 28 of each 28-day cycle. COC + placebo were taken together, once daily, in the morning, and with a meal. This 28-day cyclic regimen was to be taken for 3 consecutive cycles.

One participant who was randomised to the placebo + COC arm but was never dosed with the blinded treatment, leading to the exclusion from the Full Analysis Set (FAS) population.

Arm type	Placebo
Investigational medicinal product name	COC tablet
Investigational medicinal product code	
Other name	(Oestrogen) Ethinylestradiol and (Progestogen) Levonorgestrel
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Taken once daily by mouth, in the morning, and at the same time each day in the order directed on the blister package.

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Tablet
Routes of administration	Oral use

Dosage and administration details:

Two matching placebo (DHEA) tablets were taken on Days 1 to 28 of each cycle.

Number of subjects in period 2^[1]	DHEA 50 mg + COC	Placebo + COC
Started	84	84
Completed	68	67
Not completed	16	17
Consent withdrawn by subject	7	8
Physician decision	-	1
Failure to meet Continuation criteria	-	1
Adverse event, non-fatal	3	3
Not specified	3	2
Lost to follow-up	2	1
Lack of efficacy	1	-
Not treated	-	1

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Of the 289 participants that completed Treatment Period 1, 168 of those participants qualified and were randomized in Treatment Period 2.

Baseline characteristics

Primary: Change from Baseline in PFSF Desire Domain at Day 168

End point title	Change from Baseline in PFSF Desire Domain at Day 168
End point description: The Profile of Female Sexual Function (PFSF) is a questionnaire completed by the participant themselves which assesses the participant's sexual function over the past 4 weeks. The PFSF has 7 domains one of which is the PFSF Desire Domain consisting of 9 questionnaire items with each item scored from 1 to 6 on a 6-point scale where 1 = "Always" and 6 = "Never". These item scores were then summed into a PFSF Desire domain score which was transformed to a 0-100 point scale where higher scores indicated a more favourable sexual function. FAS: All participants who were randomized to one of the blinded treatment arms and took at least 1 dose of blinded study treatment. Participants were analyzed according to their randomized treatment regardless of the actual treatment received.	
End point type	Primary
End point timeframe: Baseline and Day 168

Secondary: Change from Baseline in Female Sexual Distress Scale-Revised (FSDS-R) Item 13 Score at Day 168

End point title	Change from Baseline in Female Sexual Distress Scale-Revised (FSDS-R) Item 13 Score at Day 168
End point description: The FSDS-R is a questionnaire completed by the participants themselves which assesses distress related to sexuality over the past 30 days. FSDS-R has 13 items, each scored on a 5-point scale, where 0 = "Never" and 4 = "Always", with higher scores indicating more sexually related distress. Item 13 specifically asks to what degree participants felt "Bothered by Low Sexual Desire" over the past 30 days. FAS: Consisted of all participants who were randomised to one of the blinded treatment arms and took at least 1 dose of blinded study treatment. Participants were analysed according to their randomised treatment regardless of the actual treatment received.

Dispersion value	3.763

Secondary: Change from Baseline in PFSF Total Score at Day 168

End point title	Change from Baseline in PFSF Total Score at Day 168
End point description:	
<p>The PFSF is a questionnaire completed by the participant themselves which assesses the participant's sexual function over the past 4 weeks. The PFSF consists of 37 questionnaire items with each item scored from 1 to 6 on a 6-point scale where 1 = "Always" and 6 = "Never" and an additional global „Satisfaction with Sexuality" item which is scored from 1 to 5 on a 5-point scale where 1 = "Poor" and 5 = "Excellent". These item scores were then summed into a PFSF Total score which was transformed to a 0-100 point scale where higher scores indicated a more favourable sexual function.</p> <p>FAS: All participants who were randomized to one of the blinded treatment arms and took at least 1 dose of blinded study treatment. Participants were analysed according to their randomised treatment, regardless of the actual treatment received.</p>

Secondary: Change from Baseline Values of Endocrine Parameters by Visit at Treatment Period 1

End point title	Change from Baseline Values of Endocrine Parameters by Visit at Treatment Period 1
-----------------	--

End point description:

All endocrine blood samples were taken between 7 AM and 9 AM. Endocrine measurements included 17-beta-Estradiol (unit: pg/ml), testosterone free serum (unit: pg/ml), testosterone total serum (unit: µg/l), sex hormone binding globulin (SHBG) (unit: nmol/l), Dehydroepiandrosterone, Prasterone (DHEA) serum (unit: µg/l), Dehydroepiandrosterone sulfate (DHEAS) serum (unit: ng/ml), dihydrotestosterone (unit: ng/l), 3 alpha-androstanediol Glucuronide (3α- ADG) (unit: ng/mL), Androstenedione serum (unit: µg/l), and estrone serum (unit: pg/ml). At the Enrolment visit it was recommended to take endocrine samples after eligibility had been confirmed and participant had been enrolled to the study.

FAS: Consisted of all participants who were randomised to one of the blinded treatment arms and took

at least 1 dose of blinded study treatment. Participants were analysed according to their randomised treatment, regardless of the actual treatment received.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

All non-serious adverse events were reported from signing the informed consent (ICF) through 7-day follow-up period. Serious adverse events were collected from signing of ICF until 30 days after last administration of study drug.

Adverse event reporting additional description:

Safety Set: Safety set consisted of all participants who were administered at least 1 dose of COC or blinded treatment. Participants were analyzed according to the treatment they received.

Assessment type	Systematic

--------------------	------

Reporting groups

Reporting group title	Combined Oral Contraceptive (COC)
-----------------------	-----------------------------------

Reporting group description:

One COC tablet containing 30 µg ethinylestradiol (EE) and 150 µg levonorgestrel (LNG) was taken orally, once daily, for 21 consecutive days, followed by a 7-day tablet-free interval from Day 22 to Day 28 of each cycle. This 28-day cyclic regimen was taken for 3 cycles in Treatment Period 1.

Reporting group title	DHEA 50 mg + COC
-----------------------	------------------

Reporting group description:

Eligible participants who completed Treatment Period 1 and qualified at the second baseline (Visit 8) continued to receive COC treatment and were randomized to also receive DHEA during Treatment Period 2. In the second treatment period, one COC tablet containing 30 µg EE and 150 µg LNG was taken on Days 1 to 21 of each cycle and two 25 mg DHEA tablets were taken on Days 1 to 28 of each 28-day cycle. COC + DHEA were taken together, once daily, in the morning, and with a meal. This 28-day cyclic regimen was to be taken for 3 consecutive cycles.

Reporting group title	Placebo + COC
-----------------------	---------------

Reporting group description:

Eligible participants who completed Treatment Period 1 and qualified at the second baseline (Visit 8) continued to receive COC treatment and were randomized to also receive placebo during Treatment Period 2. In the second treatment period, one COC tablet containing 30 µg EE and 150 µg LNG was taken on Days 1 to 21 of each cycle and two matching placebo (DHEA) tablets were taken on Days 1 to 28 of each 28-day cycle. COC + placebo were taken together, once daily, in the morning, and with a meal. This 28-day cyclic regimen was to be taken for 3 consecutive cycles.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
12 April 2021	<ul style="list-style-type: none">-It was planned that approximately 55 centres would be initiated for this study in up to 7 countries in geographical Europe.-Planned duration of participant's participation extended up to approximately 34 weeks (including screening and safety follow-up).-Replaced "Exploratory" with "Additional" to harmonise naming of Objective with Additional endpoint.-Resolved discrepancy in listing of objectives and endpoints-Updated exclusion criteria to include the presence of more than one risk factor (for women ≤ 35 years of age) or one risk factor (for women > 35 years of age) for vascular disease (eg, dyslipoproteinaemia; smoking; venous or arterial thromboembolism in sibling or parent below the age of 50; controlled arterial hypertension; obesity [BMI over 30 kg/m²]; migraine).-Updated exclusion criteria to include a history during pregnancy or during previous oestrogen use of severe pruritus, herpes gestationis, or deterioration of otosclerosis, chloasma, hereditary or acquired vasomotor oedema.-Updated statistical methods and secondary endpoints from Treatment Period 2 baseline to Day 168 for analysis of the FSDS-R Item 13, using an Analysis of covariance model with Treatment Period 2 baseline values as a covariate and treatment group as factor.-Updated statistical methods and secondary endpoints to the proportion of participants answering the Patient's Meaningful Benefit Question with "yes" was to be analysed by logistic regression using treatment group as factor.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
01 June 2021	Screening was put on hold globally for the study between 01 June 2021 and re-started on 15 November 2021. Reason: Expiry of old Biosteron (DHEA) and lack of Biosteron availability on the market necessitated putting screening on-hold.	15 November 2021
