Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 July 2021
Is this the analysis of the primary completion data?	Yes
Primary completion date	19 May 2021
Global end of trial reached?	Yes
Global end of trial date	19 May 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The objective of this clinical trial is to investigate the relation between timing of treatment onset with cineole and course of a common cold with or without acute bronchitis.

Protection of trial subjects:

A SARS-CoV-2 test was performed at visit 2 to exclude Covid-19 positive patients from participation at the study.

Despite this, in the event of fever and / or profound / protracted pain the patients were allowed to use rescue medication (paracetamol 500 mg).

Background therapy:

Not applicable.

Evidence for comparator:

As this trial aimed to investigate the relation between the timing of treatment onset with cineole and the course of a common cold with or without acute bronchitis, there was no treatment concurrent control or active comparator concurrent control.

Actual start date of recruitment	17 September 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 522
Worldwide total number of subjects	522
EEA total number of subjects	522

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	505

From 65 to 84 years	17
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The subjects were recruited in 25 practices of general practitioners, otolaryngologists and specialists in internal medicine throughout Germany from 17th September 2020 until 19th May 2021.

Pre-assignment

Screening details:

Adult outpatients recollecting having at least 1 common cold in the last winter season were eligible for study participation if they meet all of the inclusion and exclusion criteria.

Period 1

Period 1 title	Screening phase
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Screening Phase
Arm description: -	
Arm type	No intervention
No investigational medicinal product assigned in this arm	

Number of subjects in period 1	Screening Phase
Started	522
Completed	522

Period 2

Period 2 title	Illness phase
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Arm title	Onset of symptoms
Arm description: -	
Arm type	No intervention
No investigational medicinal product assigned in this arm	

Number of subjects in period 2^[1]	Onset of symptoms
Started	329
Completed	329

Notes:

[1] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Not all patients fulfilled the criteria to enter the next period.

Period 3

Period 3 title	Treatment phase
Is this the baseline period?	Yes ^[2]
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	≤12 h

Arm description:

Time to treatment stratum ≤12 h

Arm type	Experimental
Investigational medicinal product name	Soledum® forte capsules
Investigational medicinal product code	R05CA13
Other name	German original name: Soledum® Kapseln forte
Pharmaceutical forms	Gastro-resistant capsule, soft
Routes of administration	Oral use

Dosage and administration details:

The IMP will be administered at home three times a day (morning, noon, evening, t.i.d.: 3x1 capsules). Treatment starts on the day of Visit 2 (Day 1) at the trial site and ends on the day of Visit 4 (Day 15±2) at home. Subjects, who recover from common cold before Visit 4, may terminate the administration of the IMP, once the first 10 WURSS-11 questions were rated by the subject "0" on two consecutive assessments in the eDiary.

On Day 1 (start of treatment), the IMP will be administered once (1x1 capsule), twice (2x1 capsule) or three times (3x1 capsule) by the subject depending on the time of Visit 2. On the day of Visit 4 (Day 15±2), the IMP will only be administered once in the morning (1x1 capsule, last dose).

IMP has to be swallowed unchewed with sufficient fluid (preferably one glass of water [200 mL]), but no hot beverage, approximately half an hour before a meal. Subjects with a sensitive stomach are recommended to take the IMP during their regular meals.

Arm title	>12 to 24 h
------------------	-------------

Arm description:

Time to treatment stratum >12 to 24 h

Arm type	Experimental
Investigational medicinal product name	Soledum® forte capsules
Investigational medicinal product code	R05CA13
Other name	German original name: Soledum® Kapseln forte
Pharmaceutical forms	Gastro-resistant capsule, soft
Routes of administration	Oral use

Dosage and administration details:

The IMP will be administered at home three times a day (morning, noon, evening, t.i.d.: 3x1 capsules). Treatment starts on the day of Visit 2 (Day 1) at the trial site and ends on the day of Visit 4 (Day 15±2) at home. Subjects, who recover from common cold before Visit 4, may terminate the administration of the IMP, once the first 10 WURSS-11 questions were rated by the subject "0" on two consecutive assessments in the eDiary.

On Day 1 (start of treatment), the IMP will be administered once (1x1 capsule), twice (2x1 capsule) or three times (3x1 capsule) by the subject depending on the time of Visit 2. On the day of Visit 4 (Day 15±2), the IMP will only be administered once in the morning (1x1 capsule, last dose).

IMP has to be swallowed unchewed with sufficient fluid (preferably one glass of water [200 mL]), but no hot beverage, approximately half an hour before a meal. Subjects with a sensitive stomach are recommended to take the IMP during their regular meals.

Arm title	>24 h
------------------	-------

Arm description:

Time to treatment stratum >24 h

Arm type	Experimental
Investigational medicinal product name	Soledum® forte capsules
Investigational medicinal product code	R05CA13
Other name	German original name: Soledum® Kapseln forte
Pharmaceutical forms	Gastro-resistant capsule, soft
Routes of administration	Oral use

Dosage and administration details:

The IMP will be administered at home three times a day (morning, noon, evening, t.i.d.: 3x1 capsules). Treatment starts on the day of Visit 2 (Day 1) at the trial site and ends on the day of Visit 4 (Day 15±2) at home. Subjects, who recover from common cold before Visit 4, may terminate the administration of the IMP, once the first 10 WURSS-11 questions were rated by the subject "0" on two consecutive assessments in the eDiary.

On Day 1 (start of treatment), the IMP will be administered once (1x1 capsule), twice (2x1 capsule) or three times (3x1 capsule) by the subject depending on the time of Visit 2. On the day of Visit 4 (Day 15±2), the IMP will only be administered once in the morning (1x1 capsule, last dose).

IMP has to be swallowed unchewed with sufficient fluid (preferably one glass of water [200 mL]), but no hot beverage, approximately half an hour before a meal. Subjects with a sensitive stomach are recommended to take the IMP during their regular meals.

Notes:

[2] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: Period 1 is the screening phase and therefore not the baseline period.

Number of subjects in period 3^[3][4]	≤12 h	>12 to 24 h	>24 h
Started	122	88	98
Completed	122	88	98

Notes:

[3] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: The enrolled patients were first in the screening phase and only a part of them became ill and entered the baseline period.

[4] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same

as the number completing the preceding period.

Justification: Not all patients fulfilled the criteria to enter the next period.

Subject analysis sets

Subject analysis set title	mITT
Subject analysis set type	Modified intention-to-treat

Subject analysis set description:

Modified intention-to-treat set (mITT) comprised all subjects:

- who received at least 4 IMP doses within the first 4 days after Visit 2 with maximum one day without treatment;
- who provided at least 5 valid WURSS-11 assessments within the first 7 days after symptom onset with a maximum of 2 days without assessment;
- without intake of antibiotics after start of IMP treatment due to symptoms associated with upper respiratory tract infections.

The mITT was used for the identification of potential confounders and for the evaluation of primary and secondary endpoints in a more "real-life" setting.

Subject analysis set title	SAF
Subject analysis set type	Safety analysis

Subject analysis set description:

Safety Set (SAF) included all subjects, who received at least one dose of the IMP. The SAF was used for analysis of safety and tolerability.

Primary: Area under the curve global symptom severity curve (AUC-WURSS) - LS Means

End point title	Area under the curve global symptom severity curve (AUC-WURSS) - LS Means
End point description:	
The primary efficacy endpoint was the Area under the curve global symptom severity (AUC-WURSS) using the primary efficacy variable subject-reported outcome WURSS-11.	
The derivation of AUC-WURSS was based on mean daily total WURSS-11 scores, which were derived by averaging evening assessment of considered symptom day and morning assessment of the subsequent day separately for each item. If only one of both assessments was available, this assessment was used as mean item score for a symptom day.	
The mean item scores for questions 2 to 10 (daily single item scores) were then summed up to the mean total score of a day. Imputation of missing data was performed up to (estimated) day of recovery.	
End point type	Primary
End point timeframe:	
The mean daily total scores (imputed) were summed up from Symptom Day 1 to Symptom Day 17 using trapezoidal approximation, which corresponds to a time frame of common cold onset to treatment day 15 (assuming treatment starts on Symptom Day 3)

Primary: Area under the curve global symptom severity curve (AUC-WURSS) LS means difference

End point title	Area under the curve global symptom severity curve (AUC-WURSS) LS means difference ^{[2][3]}
End point description: Below the LS means difference were presented.	
End point type	Primary

End point timeframe:

The mean daily total scores (imputed) were summed up from Symptom Day 1 to Symptom Day 17 using trapezoidal approximation, which corresponds to a time frame of common cold onset to treatment day 15 (assuming treatment starts on Symptom Day 3).

Notes:

[2] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: It is the same statistical analysis as for the other primary endpoint.

[3] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This is due to the LS means difference. The results show the difference to the third arm.

Adverse events

Adverse events information^[1]

Timeframe for reporting adverse events:

AE recording started after first IMP administration and ended at last trial visit per subject, related AEs 1 week after last intake. Not recovered AEs were to be followed up until resolved or stabilized so that no further improvement could be expected.

Adverse event reporting additional description:

At each visit, the investigator assessed by asking an open standard question (Have anything changed in your state of health since you last came to see me?) if any AEs (non-serious and serious) had occurred. Any AEs, spontaneously reported by the subject or by the subject's relatives/delegates or observed by the investigator were to be recorded.

Assessment type	Systematic
-----------------	------------

Dictionary used

Dictionary name	MedDRA
Dictionary version	23.0

Reporting groups

Reporting group title	Safety Set
-----------------------	------------

Reporting group description:

Safety set (SAF) included all subjects, who received at least one dose of the IMP. The SAF was used for analysis of safety and tolerability.

Serious adverse events	Safety Set		
Total subjects affected by serious adverse events			
subjects affected / exposed	0 / 329 (0.00%)		
number of deaths (all causes)	0		
number of deaths resulting from adverse events	0		

Frequency threshold for reporting non-serious adverse events: 5 %

Non-serious adverse events	Safety Set		
Total subjects affected by non-serious adverse events			
subjects affected / exposed	0 / 329 (0.00%)		

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: The threshold to report non-serious adverse events is 5%. None of the non-serious AEs had a frequency of 5% or more.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
18 November 2020	<p>Amendment 1 introduced the rapid antigen SARS-CoV-2 test as alternative to the PCR test.</p> <p>During the trial, new test methods for SARS-CoV-2 had been established, i.e., an antigen rapid test became commercially available on the market. To allow the sites also to use this antigen rapid test as an alternative to the already implemented PCR-test, this protocol amendment became necessary. The sites could use either the PCR test or the antigen rapid test. The advantage of the antigen rapid test was, that the result was available within a couple of minutes and a decision of exclusion of subject from further trial participation could be made immediately. Furthermore, the currently limited test capacities for PCR test were not blocked for trial purposes. This change was considered as a substantial change to the protocol.</p> <p>In parallel, some other minor protocol specifications were also changed (non-substantial).</p>

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
