

**Clinical trial results:**

Randomized, controlled, double-blind, multi-center trial to evaluate the efficacy and safety of “Lixim 70 mg wirkstoffhaltiges Pflaster” (etofenamate 70 mg medicated plaster) applied once daily (every 24 hours) or twice daily (every 12 hours) vs. matching placebo in the short-term symptomatic treatment of local pain in acute uncomplicated ankle sprains in adults

Summary

EudraCT number	2020-001032-99

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	15 October 2021
Is this the analysis of the primary completion data?	No
<hr/>	
Global end of trial reached?	Yes
Global end of trial date	04 May 2021
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To demonstrate that the Lixim plaster applied once every 24 hours is superior to matching placebo plasters, in particular with regard to pain relief.

Protection of trial subjects:

This clinical trial was designed and was implemented and reported in accordance with the ICH Harmonized Tripartite Guidelines for Good Clinical Practice, with applicable local regulations (including applicable European Directives, AMG and GCP-V), and with the ethical principles laid down in the Declaration of Helsinki.

Every patient was informed verbally and also in writing, with a patient information leaflet explaining the nature of the study, its objectives, the study medication and potential risks, the rights and obligations of the participant and the fact that he was free to withdraw his consent at any time without giving any reason. Details of indemnity and insurance were also stated. All questions about the trial were answered to the satisfaction of the patient.

Women of child bearing potential had to be informed that taking the IMP may involve unknown risks to the fetus if pregnancy occurred during the clinical trial and agree that in order to participate in the clinical trial, they must adhere to the contraception requirement for the duration of the clinical trial.

Prior to the participation in the trial, a written informed consent form had to be signed and personally dated by the subject and by the person who conducted the informed consent. The patient's information and informed consent form were available in the local language.

The final trial protocol together with the patient information sheet, the informed consent form and the Investigator's drug brochure were submitted to the involved Ethics Committees and were constituted to fulfil regulatory laws. The study was approved by all Ethics Committees before clinical trial start.

Background therapy:

Not applicable.

Evidence for comparator:

None.

List of abbreviations:

ADR - Adverse Drug Reaction

AE - Adverse event

AMG - Arzneimittelgesetz, German Medicinal Products Act

ANOVA - Analysis of Variance

ATC - Anatomical Therapeutic Chemical Classification System

AUC - Area under the Curve

BID - twice daily, from Latin "bis in die"

BMI - Body-Mass Index

C - Concentration

FAS - Full Analysis Set

FDA - Food and Drug Administration

GCP - Good Clinical Practice

GLP - Good Laboratory Practice

GMP - Good Manufacturing Practice

h - hours

ICF - Informed Consent Form

ICH - International Council for Harmonisation of Technical Requirements for Pharmaceuticals for Human Use
IMP - Investigational Medicinal Product
kg - kilogram
l/L - Litre

Actual start date of recruitment	01 September 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 223
Worldwide total number of subjects	223
EEA total number of subjects	223

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	223
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

In total, 223 male and female adult patients with local pain in acute uncomplicated ankle sprains and aged on average 36.0 years were enrolled from four study centers in Germany between November 2020 and May 2021.

Pre-assignment

Screening details:

Subjects were eligible for enrollment according to the trial inclusion and exclusion criteria.

Period 1

Period 1 title	Treatment (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Subject, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

The clinical trial was double-blind with respect to allocation to active and placebo plasters from the time of randomization until database lock, using the following methods:

- (1) randomization data were kept strictly confidential, accessible only to authorized persons, until the time of unblinding;
- (2) the identity of the treatments was concealed by the use of IMPs that were all identical in packaging, labeling, schedule of administration, appearance and odor.

Arms

Are arms mutually exclusive?	Yes
Arm title	Lixim plaster applied once daily (o.d.)

Arm description:

All patients were randomly assigned (allocation ratio 5:2:5:2) to double-blind treatment (Lixim plaster once daily, placebo once daily, Lixim plaster twice daily, placebo twice daily).

All patients received in total two packs containing 7 plasters each of IMP drug. The first plaster was applied at the clinical trial site by the investigator or the designee.

In this arm patients were instructed to apply a plaster approximately every 24 hours (in the morning or the evening, depending on time of first plaster application) for the following 7 days.

Arm type	Experimental
Investigational medicinal product name	Lixim 70 mg wirkstoffhaltiges Pflaster
Investigational medicinal product code	
Other name	etofenamate 70 mg medicated plaster
Pharmaceutical forms	Cutaneous patch
Routes of administration	Topical

Dosage and administration details:

One plaster of Lixim 70 mg wirkstoffhaltiges Pflaster applied topically once daily (morning or evening) to the affected side of the injured ankle for 7 (± 1) days.

Arm title	Lixim plaster applied twice daily (b.i.d.)
------------------	--

Arm description:

All patients were randomly assigned (allocation ratio 5:2:5:2) to double-blind treatment (Lixim plaster once daily, placebo once daily, Lixim plaster twice daily, placebo twice daily).

All patients received in total two packs containing 7 plasters each of IMP drug. The first plaster was applied at the clinical trial site by the investigator or the designee.

In this arm patients were instructed to apply a plaster approximately every 12 hours (in the morning and in the evening) for the following 7 days.

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Lixim 70 mg wirkstoffhaltiges Pflaster
Investigational medicinal product code	
Other name	etofenamate 70 mg medicated plaster
Pharmaceutical forms	Cutaneous patch
Routes of administration	Topical

Dosage and administration details:

One plaster of Lixim 70 mg wirkstoffhaltiges Pflaster applied topically twice daily (morning and evening) to the affected side of the injured ankle for 7 (\pm 1) days.

Arm title	Placebo applied once daily (o.d.)
------------------	-----------------------------------

Arm description:

All patients were randomly assigned (allocation ratio 5:2:5:2) to double-blind treatment (Lixim plaster once daily, placebo once daily, Lixim plaster twice daily , placebo twice daily).

All patients received in total two packs containing 7 plasters each of IMP drug. The first plaster was applied at the clinical trial site by the investigator or the designee.

In this arm patients were instructed to apply a plaster approximately every 24 hours (in the morning or the evening, depending on time of first plaster application) for the following 7 days.

Arm type	Placebo
Investigational medicinal product name	Placebo plaster
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cutaneous patch
Routes of administration	Topical

Dosage and administration details:

The placebo plaster was identical in composition to the Lixim plaster, without the active ingredient. One placebo plaster was applied topically once daily (morning or evening) to the affected side of the injured ankle for 7 (\pm 1) days.

Arm title	Placebo applied twice daily (b.i.d.)
------------------	--------------------------------------

Arm description:

All patients were randomly assigned (allocation ratio 5:2:5:2) to double-blind treatment (Lixim plaster once daily, placebo once daily, Lixim plaster twice daily , placebo twice daily).

All patients received in total two packs containing 7 plasters each of IMP drug. The first plaster was applied at the clinical trial site by the investigator or the designee.

In this arm patients were instructed to apply a plaster approximately every 12 hours (in the morning and in the evening) for the following 7 days.

Arm type	Placebo
Investigational medicinal product name	Placebo plaster
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Cutaneous patch
Routes of administration	Topical

Dosage and administration details:

The placebo plaster was identical in composition to the Lixim plaster, without the active ingredient. One placebo plaster was applied topically twice daily (morning and evening) to the affected side of the injured ankle for 7 (\pm 1) days.

Statistical analyses

Statistical analysis title	Test vs. placebo o.d.
Statistical analysis description:	
For quantitative outcomes assessed at the clinical trial site (POM, PAR, ankle swelling) and derived outcomes (change from baseline, AUC) null hypothesis was to be tested with an analysis of covariance (ANCOVA) model with baseline value as covariate and site as fixed factor. The least square mean for each treatment and the corresponding difference between least square means (Lixim plaster - placebo) with the p-value and 95 % confidence interval were to be presented from the model.

Secondary: Pain-at-rest (PAR) - change from baseline at V5

End point title	Pain-at-rest (PAR) - change from baseline at V5
End point description:	
The patient was asked to sit down on a chair with the injured leg touching the ground. After five minutes of sitting in this position, the extent of ankle pain was evaluated by the patient in answer to the question: "How would you describe your ankle pain right now?" ("Wie würden Sie Ihre Schmerzen in Ihrem Sprunggelenk in diesem Moment beschreiben?"). The patient drew a perpendicular line on a 100 mm Visual Analogue Scale (VAS) with anchors at 0 = "no pain (keine Schmerzen)" and 100 = "Extreme pain (extreme Schmerzen)" to reflect the pain intensity at rest.	
End point type	Secondary
End point timeframe:	
Pain-at-rest (PAR) was evaluated at Visits 1-7.

Secondary: Ankle swelling V2 (12h)

End point title	Ankle swelling V2 (12h)
End point description:	Ankle swelling was evaluated by the Figure-of-eight-method. The Figure-of-eight-method was reproduced by using bony landmarks about the ankle. Common sites of ankle sprain swelling are the anterior talofibular ligament, calcaneofibular ligament, and anterior tibiofibular ligament. Because the tape spans each of these anatomical areas, the Figure-of-eight-method may offer a more accurate clinical assessment of ankle swelling. Each ankle was measured three times and the average was calculated. The difference in this average between ankles tracked the natural course of disease. The differences between the active groups and the placebo group were a measure of treatment efficacy.
End point type	Secondary
End point timeframe:	Ankle swelling was evaluated at Visits 1-7.

upper limit	-251
Variability estimate	Standard error of the mean
Dispersion value	97.9

Secondary: SPID 0-72 h

End point title	SPID 0-72 h
End point description:	
SPID was calculated using following equation: $\sum PIDI \times (t_{i+1} - t_i)$, with $PIDI = [POM \text{ on VAS at Visit } i] - [POM \text{ on VAS at Visit 1 (BL)}]$ and $t = \text{time of Visit } i$. A higher score indicated less pain.	
End point type	Secondary

Reporting groups

Reporting group title	Lixim plaster applied once daily (o.d.)
-----------------------	---

Reporting group description:

All patients were randomly assigned (allocation ratio 5:2:5:2) to double-blind treatment (Lixim plaster once daily, placebo once daily, Lixim plaster twice daily, placebo twice daily).

All patients received in total two packs containing 7 plasters each of IMP drug. The first plaster was applied at the clinical trial site by the investigator or the designee.

In this arm patients were instructed to apply a plaster approximately every 24 hours (in the morning or the evening, depending on time of first plaster application) for the following 7 days.

Reporting group title	Lixim plaster applied twice daily (b.i.d.)
-----------------------	--

Serious adverse events	Lixim plaster applied once daily (o.d.)	Lixim plaster applied twice daily (b.i.d.)	Placebo applied once daily (o.d.)
Total subjects affected by serious adverse events			
subjects affected / exposed	0 / 80 (0.00%)	0 / 80 (0.00%)	0 / 31 (0.00%)
number of deaths (all causes)	0	0	0
number of deaths resulting from adverse events	0	0	0

Serious adverse events

Placebo applied twice daily (b.i.d.)		
--------------------------------------	--	--

Total subjects affected by serious adverse events			
subjects affected / exposed	0 / 32 (0.00%)		
number of deaths (all causes)	0		
number of deaths resulting from adverse events	0		

Frequency threshold for reporting non-serious adverse events: 0 %

Non-serious adverse events	Lixim plaster applied once daily (o.d.)	Lixim plaster applied twice daily (b.i.d.)	Placebo applied once daily (o.d.)
Total subjects affected by non-serious adverse events			
subjects affected / exposed	0 / 80 (0.00%)	0 / 80 (0.00%)	0 / 31 (0.00%)

Non-serious adverse events	Placebo applied twice daily (b.i.d.)		
Total subjects affected by non-serious adverse events			
subjects affected / exposed	0 / 32 (0.00%)		

Notes:

[1] - There are no non-serious adverse events recorded for these results. It is expected that there will be at least one non-serious adverse event reported.

Justification: During the course of the clinical trial no adverse events were reported for any patient of any of the treatment groups.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? No

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
