Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-000402-PIP03-17
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 April 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	06 August 2024
Global end of trial reached?	Yes
Global end of trial date	17 April 2025
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The purpose of the study was to evaluate the efficacy of lacosamide (LCM) versus an Active Comparator chosen based on standard of care (StOC) in severe and nonsevere seizure burden (defined as total minutes of electroencephalographic neonatal seizures (ENS) per hour) in neonates with seizures that are not adequately controlled with previous anti-epileptic drug (AED) treatment.

Protection of trial subjects:

During the conduct of the study all participants were closely monitored.

Background therapy: -

Evidence for comparator:

The local standard of care was employed as comparator.

Actual start date of recruitment	31 March 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 1
Country: Number of subjects enrolled	United States: 28
Worldwide total number of subjects	29
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	29
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0

85 years and over	0
-------------------	---

Subject disposition

Recruitment

Recruitment details:

The study started enrollment in March 2021 and concluded in October 2024. The decision to end the study prematurely was made by the Sponsor in April 2025. During Enrollment Period: 11 randomized participants started and completed Active Comparator (AC) arm and 15 randomized participants started and completed lacosamide (LCM) arm.

Pre-assignment

Screening details:

Participant Flow refers to the Safety Set (based on treatment received). For the Full Analysis Set (based on treatment assignment, 1 participant randomized to LCM received AC): 10/11 participants randomized to AC and 15/15 randomized to LCM completed the treatment period. All participants from the Treatment Period entered/completed the SFU Period.

Period 1

Period 1 title	Enrollment Period (Up to 36 hours)
Is this the baseline period?	No
Allocation method	Not applicable
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	No Treatment

Arm description:

Participant signed the informed consent form, successfully screened and randomized but never received any study medication during the study.

Arm type	No intervention
No investigational medicinal product assigned in this arm	
Arm title	Active Comparator

Arm description:

Study participants randomized to receive Active Comparator (chosen and dosed based on standard of care (StOC) per local practice and treatment guidelines) in the Treatment Period. After the Treatment Period, study participants had the option to continue to receive randomized Active Comparator in the Extension Period (up to 28 days of postnatal age). Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day Safety Follow-up (SFU) Period with optional down titration.

Arm type	No intervention
No investigational medicinal product assigned in this arm	
Arm title	Lacosamide

Arm description:

Study participants randomized to receive lacosamide 10 milligram per milliliter (mg/mL) 3 times a day as an intravenous infusion over 30 minutes for up to 96 hours in the Treatment Period. After the Treatment Period, study participants had the option to continue to receive randomized lacosamide in the Extension Period (up to 28 days of postnatal age), being switched to oral dosing of lacosamide as soon as medically possible. Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Arm type	No intervention
No investigational medicinal product assigned in this arm	

Number of subjects in period 1	No Treatment	Active Comparator	Lacosamide
Started	3	12	14
Completed	0	12	14
Not completed	3	0	0
Adverse event, non-fatal	1	-	-
Withdrawal by Parent/Guardian	1	-	-
Protocol deviation	1	-	-

Period 2

Period 2 title	Treatment Period (Up to 96 hours)
Is this the baseline period?	Yes ^[1]
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Assessor ^[2]

Arms

Are arms mutually exclusive?	Yes
Arm title	Active Comparator

Arm description:

Study participants randomized to receive Active Comparator (chosen and dosed based on StOC per local practice and treatment guidelines) in the Treatment Period. After the Treatment Period, study participants had the option to continue to receive randomized Active Comparator in the Extension Period (up to 28 days of postnatal age). Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Arm type	Active comparator
Investigational medicinal product name	Active Comparator
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Infusion, Injection
Routes of administration	Intravenous use

Dosage and administration details:

Active Comparator treatment was chosen and dosed based on StOC (per local practice and treatment guidelines).

Arm title	Lacosamide
------------------	------------

Arm description:

Study participants randomized to receive lacosamide 10 milligram per milliliter (mg/mL) 3 times a day as an intravenous infusion over 30 minutes for up to 96 hours in the Treatment Period. After the Treatment Period, study participants had the option to continue to receive randomized lacosamide in the Extension Period (up to 28 days of postnatal age), being switched to oral dosing of lacosamide as soon as medically possible. Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Lacosamide
Investigational medicinal product code	
Other name	LCM
Pharmaceutical forms	Solution for infusion, Oral solution
Routes of administration	Intravenous use, Oral use

Dosage and administration details:

Participants received lacosamide 10 mg/mL as an intravenous (IV) infusion up to 96 hours of Treatment Period. Study participants who remain inpatient and who benefit from the LCM treatment may continue LCM if able to switch to oral LCM in the Extension Period (up to 28 days of postnatal age). Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Notes:

[1] - Period 1 is not the baseline period. It is expected that period 1 will be the baseline period.

Justification: Data cannot be reported for 3 participants due to data protection/data privacy.

[2] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: This is an open label study however, central readers for the EEG were blinded.

Number of subjects in period 2^[3]	Active Comparator	Lacosamide
Started	12	14
Safety Set (Actual Treated)	12	14
Completed	11	14
Not completed	1	0
Consent withdrawn by parent/guardian, not due to AE	1	-

Notes:

[3] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 29 participants were screened and enrolled in this study but only 26 participants were treated.

Period 3

Period 3 title	Extension Period: up to 28 Days of PNA
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Single blind
Roles blinded	Assessor ^[4]

Arms

Arm title	Lacosamide
------------------	------------

Arm description:

Study participants randomized to receive lacosamide 10 mg/mL 3 times a day as an intravenous infusion over 30 minutes for up to 96 hours in the Treatment Period. After the Treatment Period, study participants had the option to continue to receive randomized lacosamide in the Extension Period (up to 28 days of postnatal age), being switched to oral dosing of lacosamide as soon as medically possible. Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Arm type	Experimental
Investigational medicinal product name	Lacosamide
Investigational medicinal product code	
Other name	LCM
Pharmaceutical forms	Solution for infusion, Oral solution
Routes of administration	Intravenous use, Oral use

Dosage and administration details:

Participants received lacosamide 10 mg/mL as an intravenous (IV) infusion up to 96 hours of Treatment Period. Study participants who remain inpatient and who benefit from the LCM treatment may continue LCM if able to switch to oral LCM in the Extension Period (up to 28 days of postnatal age). Participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Notes:

[4] - The roles blinded appear inconsistent with a simple blinded trial.

Justification: This is an open label study however, central readers for the EEG were blinded.

Number of subjects in period 3^[5]	Lacosamide
Started	12
Completed	12

Notes:

[5] - The number of subjects starting the period is not consistent with the number completing the preceding period. It is expected the number of subjects starting the subsequent period will be the same as the number completing the preceding period.

Justification: Out of 15 randomized participants who completed the Treatment Period, 12 participants opted to continue in the Extension Period.

Study participants (whether they discontinued randomized treatment during the Treatment Period, completed the Extension Period, were discharged from the hospital, or reached 28 days of postnatal age) then entered the 14-day SFU Period with optional down titration.

Subject analysis set title	Lacosamide
----------------------------	------------

Subject analysis set type	Full analysis
---------------------------	---------------

Subject analysis set description:

Study participants randomized to receive lacosamide 10 milligram per milliliter (mg/mL) 3 times a day as an intravenous infusion over 30 minutes for up to 96 hours. The dose of LCM could be reduced based on clinical judgement of the investigator after the first dose. Study participants who remain inpatient and who benefit from the LCM treatment may continue LCM if able to switch to oral LCM in the Extension Period. One participant was randomized to lacosamide but actually received Active Comparator. Therefore, based on randomization assignment, 15 participants are in the LCM arm in the full analysis.

Primary: Change in Seizure Burden Measured in the Evaluation Video-electroencephalogram (video-EEG) Compared with the Baseline Video-EEG

End point title	Change in Seizure Burden Measured in the Evaluation Video-electroencephalogram (video-EEG) Compared with the Baseline Video-EEG ^[1]
-----------------	--

End point description:

Baseline seizure burden=seizure burden measured on continuous video-EEG (total electroencephalographic neonatal seizures (ENS) in minutes per hour) during period of up to 2 hours immediately prior to 1st administration of study drug. ENS= EEG seizure lasting for at least 10 seconds on video-EEG. Seizure burden in Evaluation Period= total duration of seizures between 1 and 3 hours after 1st dose of study medication divided by duration of interpretable video-EEG available in same period. Change in seizure burden measured in Evaluation video-EEG compared with Baseline video-EEG was analyzed such that positive value= reduction in seizure burden from baseline. Full Analysis Set (FAS) consisted of all study participants in SS who had minimum of 30 minutes of interpretable video-EEG data from both Baseline and period between 1 and 3 hours (Evaluation Period) after randomization to initial study medication treatment. "N"= participants evaluable for this assessment. FAS=randomized treatment.

End point type	Primary
----------------	---------

End point timeframe:

During 2-hour Evaluation starting 1 hour after initial treatment (up to 2 hours), compared to Baseline

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

End point values	Active Comparator	Lacosamide		
Subject group type	Reporting group	Reporting group

Statistical analyses

Secondary: Time to Response Across the 48-hour Treatment Period Compared with the Baseline Video-EEG

End point title	Time to Response Across the 48-hour Treatment Period Compared with the Baseline Video-EEG ^[4]
-----------------	--

End point description:

Time to response where response was defined as a reduction in seizure burden from Baseline of at least 80% in participants with non-severe seizure burden, and of at least 50% for participants with severe seizure burden. Time to response was censored at the date/time the participant received rescue medication or stopped video-EEG monitoring, or otherwise at the end of the 48-hour period. The FAS was used, and population was based on randomized treatment. Here, 99999 and -99999 refers to upper and lower limits of 95% confidence interval could not be calculated by the Kaplan-Meier model due to heavy censoring occurring before the median survival time was observed and a lack of variability in the response times (9/10 patients reported the same time to response).

End point type	Secondary
----------------	-----------

End point timeframe:

Across the first 48 hours of Treatment Period, compared to Baseline

Notes:

[4] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

Secondary: Time to Seizure Freedom Across the First 48-hour Treatment Period Compared with the Baseline Video-EEG

End point title	Time to Seizure Freedom Across the First 48-hour Treatment Period Compared with the Baseline Video-EEG ^[5]
-----------------	---

End point description:

Seizure freedom was defined as 0 minutes of seizures in a 1-hour period (or 2-hour period for the 3-hour time point) and was analyzed across the 48 hours. The time to seizure freedom was measured in hours, defined as the first time point when the response criterion was met minus the date and time of the first dose of randomized study medication administration. Time to seizure freedom was censored at the time of receiving rescue medication, stopping video-EEG monitoring or otherwise at 48 hours after first dose. The FAS was used, and population was based on randomized treatment. Here, 99999 and -99999 refers to upper and lower limits of 95% confidence interval could not be calculated by the Kaplan-Meier model due to heavy censoring occurring before the median survival time was observed and a lack of variability in the response times (4/6 participants [Active Comparator] and 9/10 participants [Lacosamide]) reported the same time to seizure freedom).

End point type	Secondary

Treatment: 47 hour-48 hour (n=4,10)	100.00 (\pm 0.00)	100.00 (\pm 0.00)		

Statistical analyses

No statistical analyses for this end point

Secondary: Percentage of Responders at the end of the First 48-hours of the Treatment Period

End point title	Percentage of Responders at the end of the First 48-hours of the Treatment Period
-----------------	---

End point description:

A responder is defined as a study participant who achieved the following reduction in seizure burden without need for rescue medication, compared with the seizure burden measured during the Baseline Period immediately prior to investigational medicinal product (IMP) administration, evaluated for a 2-hour period starting 1 hour after the start of initial treatment: At least 80% reduction of seizure burden in participants who were categorized as having nonsevere seizure burden during Baseline OR At least 50% reduction of seizure burden in participants who had at least one 30-minute period of severe seizure burden during Baseline. The denominator for the percentages was based on the number of participants with video- EEG data available at the 48 hour time point. FAS was used, and population was based on randomized treatment. Here, "N" included all participants who were evaluable for this assessment.

End point type	Secondary

Secondary: Percentage of Study Participants who are Seizure-free (100% Reduction in Seizure Burden from Baseline) at 24 hours After Start of the Treatment Period, Categorized by Study Participants with Non severe or Severe Seizure Burden at Baseline

End point title	Percentage of Study Participants who are Seizure-free (100% Reduction in Seizure Burden from Baseline) at 24 hours After Start of the Treatment Period, Categorized by Study Participants with Non severe or Severe Seizure Burden at Baseline
-----------------	--

End point description:

Seizure free was defined as 100% reduction in seizure burden or having no seizures in the assessment period (23 to 24 hours after first dose) from Baseline. For the study participants with severe seizure burden at Baseline (as determined by the Investigator), the numerator was defined as the number of participants with severe seizure burden at Baseline who had no seizures between 23 and 24 hours after the start of the Treatment Period. The denominator for the percentages was based on the number of participants with video-EEG data available at the 24 hour time point. FAS was used and population was based on randomized treatment. Here, "N" included all participants who were evaluable for this assessment and "n"= participants evaluable for specified seizure burden categories.

No statistical analyses for this end point

Secondary: Serum Concentration of Lacosamide

End point title	Serum Concentration of Lacosamide ^[6]
-----------------	--

End point description:

Serum concentrations of lacosamide were measured and concentration data were summarized. PK sparse sampling was performed. The Pharmacokinetic Per-Protocol Set (PK-PPS) consisted of all study participants who provide at least 1 measurable serum sample (with recorded sampling time) on at least 1 post-Baseline visit with documented study drug intake times. Here, overall number of participants analyzed "N" included all participants who were evaluable for this assessment, number analyzed (n) signifies participants who were evaluable at specified timepoints and 99999 refers to Geometric mean and Geometric Coefficient of Variation could not be calculated due to less number of participants.

End point type	Secondary
----------------	-----------

End point timeframe:

Day 1: 30-90 minutes and 6 - 8 hours after start of first infusion, 30 - 90 minutes and 6 - 8 hours after start of second or third infusion, Days 2, 3 and 4

Notes:

[6] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: No formal statistical hypothesis testing was planned for this study. Results were summarized as descriptive statistics only.

End point values	Lacosamide			
Subject group type	Reporting group

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Enrolment: Screening (-36 hours) up to 0 hours (pre-dose); Treatment: From first administration of study treatment to the End of Safety Follow-up (up to Day 42)

Adverse event reporting additional description:

TEAEs are defined as AEs which had onset on or after the start date and time of initial study medication administration. SS was used. Eligible participants who did not undergo any treatment of lacosamide but experienced an AE, are presented in a separate group "No Treatment".

Assessment type	Non-systematic

Reporting groups

Reporting group title	No Treatment
-----------------------	--------------

Reporting group description:

Participant signed the informed consent form, successfully screened and randomized but never received any study medication during the study.

Reporting group title	Lacosamide
-----------------------	------------

Reporting group description:

Participants received lacosamide 10 milligram per milliliter (mg/mL) 3 times a day as an intravenous infusion over 30 minutes for up to 96 hours. The dose of LCM could be reduced based on clinical judgement of the investigator after the first dose.

Reporting group title	Active Comparator
-----------------------	-------------------

Reporting group description:

Study participants randomized to receive Active Comparator chosen based on standard of care (StOC) (per local practice and treatment guidelines) in the Clinical Practice in the Treatment Period.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
13 October 2020	Protocol Amendment 1 was dated 13 Oct 2022. The purpose of this substantial amendment was changes to the protocol have been made to simplify the study logistics, to update secondary objectives, to provide updated data from the pediatric PK model, and to improve consistency within the protocol. Minor grammatical, editorial, and formatting changes have also been made for clarification purposes only.
11 February 2022	Protocol Amendment 2 was dated 11 Feb 2022. The purpose of this substantial amendment was to change the protocol and made it align to the study more closely with the Neonatal Intensive Care Unit's (NICU) standard of care and practice, clarify the age criterion, clarify the Schedule of Activities, align with the current Statistical Analysis Plan (SAP), and align with the current Iacosamide (LCM) clinical development program. Minor grammatical, editorial, and formatting changes have also been made for clarification purposes only.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The study ended prematurely after agreed PIP modification; termination was not linked to any safety issues/reasons.

Notes:
