

Clinical trial results:

A Phase III, randomized, double-blind, placebo controlled multi-country study to demonstrate efficacy of a single dose of unadjuvanted RSV Maternal vaccine, administered IM to pregnant women 18 to 49 years of age, for prevention of RSV associated LRTI in their infants up to 6 months of age

Notes:

General information about the trial

Main objective of the trial:

- To assess the efficacy of a single dose of the RSV Maternal vaccine administered to maternal participants in preventing medically assessed, RSV-associated severe LRTIs in their infant participants up to 6 months of age.
- To assess the efficacy of a single dose of the RSV Maternal vaccine administered to maternal participants in preventing medically assessed, RSV-associated LRTIs of any severity in their infant participants up to 6 months of age.
- To evaluate the safety of the RSV Maternal vaccine in infants born to mothers who were vaccinated with a single intramuscular (IM) dose of study vaccine, up to 12 months after birth.

Protection of trial subjects:

All maternal participants were observed closely for at least 30 minutes after the administration of the vaccine/product. Appropriate medical treatment was readily available during the observation period in case of anaphylaxis and/or syncope. Vaccines/products were administered by qualified and trained personnel. Vaccines/products were administered only to eligible participants that had no contraindications to any components of the vaccines/products.

Subject disposition

Recruitment

Recruitment details: -

Pre-assignment

Screening details:

A total of 11194 participants (5959 maternal participants and 5235 infants) completed the informed consent process, of which 5328 maternal participants were exposed to the study intervention, and 5235 infants were born to those exposed mothers (RSV MAT Group - Mother and Placebo Group - Mother). Therefore, 10563 participants started the study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Blinding implementation details:

The study was conducted in a double-blinded manner, but the study was unblinded following the decision to stop enrollment and vaccination in the study due to a safety signal.

Arms

Are arms mutually exclusive?	Yes
Arm title	RSV MAT Group - Mother

Arm description:

Maternal participants received a single dose of the RSV MAT vaccine administered at Day 1 in this study.

Arm type	Experimental
Investigational medicinal product name	RSV MAT
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder and solution for solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Single dose of the RSV MAT vaccine reconstituted with NaCl solution, administered intramuscularly in the non-dominant arm, at Day 1.

Arm title	Placebo Group - Mother
------------------	------------------------

Arm description:

Maternal participants received a single dose of placebo administered at Day 1 in this study.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Powder and solution for solution for injection
Routes of administration	Intramuscular use

Dosage and administration details:

Single dose of Placebo (lyophilized sucrose reconstituted with NaCl solution), administered intramuscularly in the non-dominant arm, at Day 1.

Arm title	RSV MAT Group - Infant
------------------	------------------------

Arm description:

This group consisted of infants born to mothers (from RSV MAT Group - Mother) who received a single dose of RSV MAT vaccine during pregnancy.

Arm type	No intervention
No investigational medicinal product assigned in this arm	

Arm title	Placebo Group - Infant
Arm description: This group consisted of infants born to mothers (from Placebo Group - Mother) who received a single dose of placebo during pregnancy.	
Arm type	No intervention
No investigational medicinal product assigned in this arm

End point description:

An RSV-associated LRTI of any severity was characterized by a history of cough OR difficulty in breathing, AND a blood oxygen saturation by pulse oximetry (SpO2) lower than (<) 95%, OR respiratory rate increase AND a confirmed RSV infection. An RSV-associated severe LRTI met the case definition of RSV-LRTI AND was additionally characterized by an SpO2 <93%, OR lower chest wall in-drawing, OR inability to feed, OR failure to respond/unconscious. Medically assessed = the infant was evaluated by a healthcare professional for the LRTI.

The analysis was performed on the Modified Full Analysis - Efficacy set for infants, which included all infant participants in the Exposed set who were born after at least 4 weeks of their maternal participants vaccination.

From Day 1 to Day 42 post-delivery, an average of 2 months

Notes:

[40] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: This endpoint is only reporting values for the maternal participants.

Secondary: Number of infant participants with neonatal AESIs from birth to Day 42 post-birth

End point title	Number of infant participants with neonatal AESIs from birth to Day 42 post-birth ^[41]
-----------------	---

End point description:

Neonatal/infant AESIs included congenital anomalies with functional defects, congenital anomalies with internal structural defects, congenital anomalies with major external structural defects, extremely low birth weight (<1000 grams), low birth weight (<2500 grams), very low birth weight (<1500 grams), neonatal death in a preterm live birth (gestational age ≥ 28 and <37 weeks), neonatal death in a term live birth (≥ 37 weeks of gestational age), neonatal death in an extremely pre-term birth (gestational age ≥ 22 and <28 Weeks), preterm birth (<37 weeks of gestational age), small for gestational age. The analysis was performed on the Exposed Set for infants, which included infants live-born to exposed maternal participants, whose parents/LARs completed the informed consent process and signed the informed consent form.

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
05 October 2020	The following points have been amended: Case definitions for lower respiratory tract illness have been modified to include the phrase "medically assessed." In addition, the success criteria for the primary objective on any RSV-associated lower respiratory tract infection has been changed. Previously the lower bound of this primary endpoint was 10%; it has been increased to 20%. The timing of interim analyses have been modified to make overall interim analyses operationally pragmatic. In addition, the corresponding study design operational characteristics have been updated.
23 June 2021	This protocol has been amended to: <ul style="list-style-type: none">• implement the changes discussed and agreed with Center for Biologics Evaluation and Research (CBER).• extend the infant respiratory tract illness (RTI) surveillance to 12 months to ensure that this period will cover at least 1 full RSV season.• remove the collection of hematocrit samples due to challenges (mostly due to the COVID-19 pandemic) faced in several countries preventing the samples from reaching the central lab in adequate time for testing.• define an additional population for analysis: Modified Full Analysis - Efficacy Set.
10 February 2022	This protocol has been amended to: <ul style="list-style-type: none">• change the trigger point for interim analyses which could lead to claim vaccine efficacy (2, 3 and 4) as there is a high chance of claiming vaccine efficacy (VE) earlier than initially anticipated.• add 2 new secondary descriptive efficacy objectives to assess VE against severe medically assessed LRTIs and any medically assessed LRTIs associated to RSV subtypes A and B separately in the infant participants from birth up to 6 months of age.• acquire further information on how the VE can be sustained up to 12 months post-birth.• remove the distribution of antibody titers/concentrations and the scatter plots showing the individual post-vaccination versus pre-vaccination results as well as scatter plots showing relationship between maternal and infants antibody titers. These analyses have already been described as part of previous completed RSV MAT studies and performing them in RSV MAT-009 (i.e. a larger sample size), is not expected to provide any additional critical information with regards to the study vaccine immunogenicity.• remove the section about predicted VE based on surrogate endpoint due to the limitation of data from internal epidemiological studies. Hence, the surrogate endpoint model cannot be robustly established and validated.
15 March 2022	Following a recommendation from the Independent Data Monitoring Committee of NCT04605159 (RSV MAT 009), GSK made the decision to stop enrolment and vaccination in the study. Ongoing study participants at that time continued to be monitored as part of the study. The Protocol was updated to reflect the change to study's safety assessment plan.

23 February 2023	<p>The following points have been amended:</p> <ul style="list-style-type: none"> • The Benefit/Risk assessment has been updated to clarify the status of the safety signals after GSK's signal validation process. • The objectives and outcome measures section was updated. • RSV IgG antibody concentrations would be assessed only in maternal blood samples collected at delivery and cord blood* [*or an infant blood sample collected within 72 hours after birth (if no cord blood sample can be obtained)]. • RSV-B neutralizing antibody titers were removed from the secondary immunogenicity analysis. • Populations for analysis were updated to reflect the changes to the statistical analysis plan of the study, following the of decision to stop further enrolment and vaccination. • Country-specific requirements have been added for Spain and Argentina.
