

## Clinical trial results:

### Randomized open pilot study to evaluate the efficacy of subcutaneous sarilumab in patients with moderate-severe COVID-19 infection.

#### Summary

EudraCT number	2020-001634-36
Trial protocol	ES
Global end of trial date	04 December 2020

#### Results information

Result version number	v1 (current)
This version publication date	28 April 2022
First version publication date	28 April 2022

#### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	04 December 2020
Is this the analysis of the primary completion data?	Yes
Primary completion date	04 December 2020
Global end of trial reached?	Yes
Global end of trial date	04 December 2020
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

-To evaluate the efficacy of the early administration of sarilumab subcutaneously in patients with moderate-severe COVID-19 infection in early stages compared to the current treatment standard.  
-To compare the baseline clinical and biological parameters, including serum IL-6, of the intervention population against historical controls, to search for possible markers that identify candidates for treatment with subcutaneous IL-6 inhibitors and attempt an approximation to the time frame of "window of opportunity".

Protection of trial subjects:

The trial was approved by the AEMPS and the Research Ethics Committee of the HUP on April 9th, 2020 (Reference number 4078) and was conducted in accordance with the principles of the Declaration of Helsinki and the Good Clinical Practice guidelines of the International Conference on Harmonization.

Background therapy:

Sarilumab (SAR) is a human monoclonal antibody that binds membrane-bound and soluble IL-6 receptors to inhibit IL-6 signaling, licensed in a subcutaneous route administration for the treatment of Rheumatoid Arthritis. At a moment where the health system was overrun, especially emergency and intensive care unit (ICU) facilities, with real concern about TCZ shortages, we conceived that subcutaneous administration of SAR could facilitate the administration of an IL-6 inhibitor in all settings, including wards and overloaded emergency rooms. Additionally, the safety and maximum pharmacodynamic effects of a single 200 mg dose of subcutaneous SAR are known through the results of two open randomized controlled trials. Data were similar to those obtained with single doses of 4 and 8 mg/kg intravenous TCZ, with a longer effect of TCZ in the second week. Our hypothesis was that the use of 2 subcutaneous SAR injections and early intervention (window of opportunity) could prevent higher oxygenation requirements through non-invasive (NI) and invasive mechanical ventilation (IMV) and reduce death rate. Thus, we proposed an open pilot pragmatic RCT to evaluate the efficacy and safety of a single 400 mg subcutaneous dose of SAR, in patients with moderate to early severe COVID-19, compared to standard care (SC).

Evidence for comparator:

The pharmacodynamic effect and safety of a single dose of sarilumab s.c (150 and 200 mg) and of tocilizumab i.v. (4 and 8 mg / kg) were evaluated in two open, randomized trials, in Japanese (n = 30) (PDY14191 [NCT02404558]) and non-Japanese (n = 101) (6R88-RA-1309 [NCT02097524]) population of patients with RA. Although there were differences in the baseline pharmacodynamic parameters between both studies, the onset of the effect on the absolute neutrophil count, C-reactive protein (CRP), serum levels of IL-6 and the soluble IL-6 receptor, during the first week after a single dose, it was similar regardless of drug, dose, or route of administration. The maximum effects on neutrophil count nadir and CRP, and on serum peaks of IL-6 and soluble IL-6 receptor were comparable in both studies for sarilumab and tocilizumab. The pharmacodynamic response was longer for i.v. tocilizumab. and there were no substantial differences in safety.

Actual start date of recruitment	13 April 2020
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

## Subject disposition

### Recruitment

#### Recruitment details:

This study was conducted in the Hospital Universitario de La Princesa in Patients older than 18 attending the emergency room of this hospital in need for hospitalization by COVID-19. All patients or their legal representatives provided oral informed consent according to the AEMPS exceptional measures applicable for COVID19 studies.

### Pre-assignment

#### Screening details:

Patients 18 and <80-years attending the emergency room with confirmed pneumonia by COVID-19. at least 2 of the following additional criteria needed to be fulfilled: Fever  $\geq 37.8^{\circ}\text{C}$ ; IL-6 in serum  $\geq 25$  pg/mL or PCR > 5mg/dL; Lymphocytes <600/mm<sup>3</sup>; Ferritin > 300  $\mu\text{g/L}$  and LDH > 250, or D-dimer > 1 mg/L.

### Period 1

Period 1 title	Only 1 period in parallel desing (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

#### Blinding implementation details:

This is an open label phase II pragmatic RCT (randomized clinical trial) to evaluate the efficacy and safety of a single 400 mg subcutaneous dose of SAR, in patients with moderate to early severe COVID-19, compared to standard care (SC). This study was open for investigators and patients.

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Sarilumab plus Standard of Care

#### Arm description:

Sarilumab Kevzara 200 mg, 2 sc injections in pre-filled syringe or pen, 400 mg single dose. The patients of this arm also received drugs, including corticosteroids, or full supportive care according to the best SC updated in the local protocol for COVID-19.

Sarilumab (ATC code L04AC14) is a fully human anti-IL-6R monoclonal IgG1 antibody that binds to both membrane bound and soluble interleukin 6 (IL-6) receptor forms, thus blocking the cis- and trans-inflammatory signalling cascades of IL-6.

Arm type	Experimental
Investigational medicinal product name	Sarilumab
Investigational medicinal product code	SAR153191
Other name	Kevzaras
Pharmaceutical forms	Solution for injection in pre-filled syringe
Routes of administration	Subcutaneous use

#### Dosage and administration details:

The pharmacodynamic and safety characteristics of a single dose of 150 and 200 mg sarilumab s.c. are known, which do not differ significantly from those obtained with single doses of 4 and 8 mg / kg of tocilizumab i.v. The administration of 2 injections s.c. of sarilumab and in earlier stages (moderate COVID-19 pneumonia or early severe disease), it was expected that it could increase the initial concentration peak and compensate for the somewhat shorter duration of its pharmacodynamic effects, described for a single 200 mg dose.

<b>Arm title</b>	Standard Care
------------------	---------------

#### Arm description:

Patients in standard care (SC) will received drugs, including corticosteroids, or full supportive care according to the best SC updated in the local protocol for COVID-19. Patients in the standard care (SC) were given the option to receive intravenous Tocilizumab (TCZ) after randomization if they worsened at investigator discretion, as this agent had become the SC in our centre when the protocol was designed.

Arm type	Active comparator
----------	-------------------

Investigational medicinal product name	Standard Care
Investigational medicinal product code	
Other name	Could use tozilizumab
Pharmaceutical forms	Solution for injection in pre-filled pen
Routes of administration	Intravenous use

Dosage and administration details:

Patients in the standard care (SC) were given the option to receive intravenous TCZ after randomization if they worsened at investigator discretion, as this agent had become the SC in our centre when the protocol was designed

<b>Number of subjects in period 1</b>	Sarilumab plus Standard of Care	Standard Care

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
06 April 2020	Positive serology (IgG/gM by ICT or IgM/IgA by ELISA) is included in the detection of Covid-19, in addition to the PCR already included in the original protocol. Study treatment defined, Kevzara 200 mg, 2 sc injections in prefilled syringe or autoinjector, 400 mg single dose. The original protocol established 400 mg or 300 mg based on the number of neutrophils.

Notes:

---

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

This is a pilot study and the small sample size is the main limitation of the study. A full analysis of the limitations of the study is included in the publication in Frontiers of medicine doi: 10.3389/fmed.2022.819621.
