End point description:

TEAEs were defined as any event, side effect, or untoward medical occurrence in a participant enrolled in a clinical study whether or not it was considered to have a causal relationship to the study drug and first occurred or worsened during the post-baseline phase compared to baseline. Clinically significant changes from baseline in vital signs and clinical laboratory results were reported as TEAEs.

Safety Population: Included all participants who received any dose (including partial doses) of any study drug. Per Section 4.1 of the statistical analysis plan (SAP), analyses were planned to be grouped by treatment, rather than by specific dose.
