Notes:

General information about the trial

Main objective of the trial:

This study was conducted to evaluate the efficacy and safety of INCB054707 in participants with hidradenitis suppurativa over a 16-week Placebo-Controlled Treatment Period followed by a 36-week Open-Label Extension Period. All eligible participants were invited to continue treatment for an additional 48-week Long-Term Extension Period (also open label).

Protection of trial subjects:

This study was to be performed in accordance with the ethical principles that have their origin in the Declaration of Helsinki and conducted in adherence to the study Protocol, applicable Good Clinical Practices, and applicable laws and country-specific regulations in which the study was conducted.

Primary: Mean change from Baseline in abscess and inflammatory nodule (AN) count at Week 16

End point title	Mean change from Baseline in abscess and inflammatory nodule (AN) count at Week 16
End point description: Change from Baseline was calculated as the post-Baseline value minus the Baseline value. The mixed model repeated measure (MMRM) included the fixed effects of treatment group (placebo and povorcitinib 15, 45, and 75 mg), stratification factors (disease severity [Hurley Stage I, II, and III] and geographical region [North America and outside of North America]), visit (Weeks 2, 4, 6, 8, 12, and 16), treatment by visit interaction, and covariates of Baseline measurement and Baseline measurement by visit interaction. The variance-covariance matrix of the within-participant errors in MMRM are modeled as unstructured. Analysis was conducted in members of the Intent-to-Treat (ITT) Population: all randomized participants. Treatment groups for this population were defined according to the treatment assignment at randomization.

Secondary: Mean change from Baseline in the severity of the disease, as assessed by the International Hidradenitis Suppurativa Severity Score System (IHS4) score, from Weeks 2 to 16

End point title	Mean change from Baseline in the severity of the disease, as assessed by the International Hidradenitis Suppurativa Severity Score System (IHS4) score, from Weeks 2 to 16
End point description:	
Change from Baseline was calculated as the post-Baseline value minus the Baseline value. The IHS4 is a composite, dynamic score and validated tool used to determine Hidradenitis Suppurativa severity. It employs a weighted scale using the number of inflammatory nodules, the number of abscesses, and the number of draining tunnels (fistulas or sinuses), with respective weight factors of 1, 2, and 4. Scores: mild=0-3; moderate=4-10; severe ≥11. MMRM included the fixed effects of treatment group (placebo and povorcitinib 15, 45, and 75 mg), stratification factors (disease severity [Hurley Stage I, II, and III] and geographical region [North America and outside of North America]), visit (Weeks 2, 4, 6, 8, 12, and 16), treatment by visit interaction, and covariates of Baseline measurement and Baseline measurement by visit interaction. End point description:

An AE was defined as any untoward medical occurrence associated with the use of a drug in humans, whether or not considered drug-related. An AE could have been any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease (new or exacerbated) temporally associated with the use of study treatment. A TEAE was defined as any AE either reported for the first time or the worsening of a pre-existing event after the first dose of study drug until the end of the safety follow-up. Analysis was conducted in members of the Long-Term Evaluable (LTE) Population, defined as all participants who received at least 1 dose of povorcitinib during the LTE Period.
