Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	30 October 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	26 May 2023
Global end of trial reached?	Yes
Global end of trial date	26 May 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The main objective was to explore whether ladarixin may improve insulin sensitivity in participants with prediabetes eligible for bariatric surgery with body mass index (BMI) ≥ 35 kg/m². The safety of ladarixin was also evaluated.

The study also aimed to explore changes in relevant metabolic and inflammatory markers/variables after ladarixin treatment.

Protection of trial subjects:

The study was conducted in accordance with the Declaration of Helsinki (October 2013), ICH GCP E6(R2), IEC guidance, and all other applicable local regulatory requirements.

Background therapy: -

Evidence for comparator:

A total of 25 participants (13 in the ladarixin arm and 12 in the placebo arm) received IMP; all completed IMP treatment including completion of the End of Cycle 1 and Follow-up visits. A total of 23 participants (12 randomized to ladarixin and 11 randomized to placebo) underwent bariatric surgery; 1 participant in each treatment group did not undergo surgery.

Actual start date of recruitment	23 April 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Italy: 26
Worldwide total number of subjects	26
EEA total number of subjects	26

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0

Adolescents (12-17 years)	0
Adults (18-64 years)	25
From 65 to 84 years	1
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

40 participants were screened for the study. Of these, 14 did not meet all inclusion/exclusion criteria. The remaining 26 were randomized: 13 to ladarixin and 13 to placebo. One patient randomized to placebo did not complete the Baseline visit due to unavailability of veins, and so didn't receive IMP and wasn't included in the analyses.

Pre-assignment

Screening details:

Potential participants were identified from those on the waiting list for bariatric surgery at one of the participating Surgery Units. After the surgeon had explained and discussed the study with a participant, any willing potential participants were referred to the CCS for consent and screening.

Period 1

Period 1 title	Overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Carer, Assessor

Blinding implementation details:

The appearance, including packaging and labelling, of IMP capsules (ladarixin and placebo) were matched so that the actual treatment could not be identified.

Arms

Are arms mutually exclusive?	Yes
Arm title	Ladarixin

Arm description:

In this arm participants received Ladarixin 400 mg (2 x200 mg capsule), administered twice a day orally for 3 cycles of 14 days each, with a 14-day wash-out between cycles, for a total of 10 weeks from first to last dose. Please note that n=13 patients of this arm completed both End of Cycle 1 visit, and Follow-up visit.

Arm type	Experimental
Investigational medicinal product name	Ladarixin
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Ladarixin was provided as hard gelatine capsules for oral administration. Each active capsule contained 200 mg ladarixin.

Capsules were to be taken at least two hours before or after meals.

Arm title	Placebo
------------------	---------

Arm description:

In this arm participants received matched placebo, administered twice a day orally for 3 cycles of 14 days each, with a 14-day wash-out between cycles, for a total of 10 weeks from first to last dose. Please note 1: One participant randomized to placebo did not complete the Baseline visit due to unavailability of veins, and consequently did not receive IMP. Please note 2: n=12 Completed both End of Cycle 1 visit and Follow-up visit.

Arm type	Placebo
----------	---------

Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Capsule, soft
Routes of administration	Oral use

Dosage and administration details:

Matched placebo capsules were administered twice a day orally for 3 cycles of 14 days each, with a 14-day interval between cycles. Hence placebo was indistinguishable compared to active drug with respect of formulation, time and way of administration and posologic scheme.

Number of subjects in period 1^[1]	Ladarixin	Placebo
Started	13	12
Completed	13	12

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: 40 participants were screened for the study. Of these, 14 did not meet all inclusion/exclusion criteria. The remaining 26 were randomized: 13 to ladarixin and 13 to placebo. One patient randomized to placebo, though, did not complete the Baseline visit due to unavailability of veins, and so didn't receive IMP and wasn't included in the analyses (n=25).

Primary: Change from baseline to follow-up in Insulin Sensitivity Index – Matsuda (ISI-M) from 3-hours Oral Glucose Tolerance Test (OGTT), calculated by Matsuda 1999

End point title	Change from baseline to follow-up in Insulin Sensitivity Index – Matsuda (ISI-M) from 3-hours Oral Glucose Tolerance Test (OGTT), calculated by Matsuda 1999
-----------------	--

End point description:

As the trial was exploratory, no primary endpoint was defined.

The insulin sensitivity Index by Matsuda (ISI-M) in general is assessed via the 3h-OGTT, the main analysis, but also via the 2h-OGTT. Generally speaking, these are standard diagnostic tests for diabetes and is commonly used to evaluate whole body glucose tolerance. Participation in the trial requires a somewhat more frequent and prolonged (up to 3 hours) sampling to better define post-load changes in glucose, insulin, proinsulin and c-peptide levels for research purposes.

Insulin Sensitivity Index-Matsuda (ISI-M) calculated by [Matsuda, 1999]:

$$ISI-M = 10,000 / \sqrt{(FPG \cdot FPI)} \cdot (MPG \cdot MPI)$$

where FPG = fasting plasma glucose (mmol/dL); FPI = fasting plasma insulin (mIU/L)
MPG = mean plasma glucose (mmol/dL); MPI = mean plasma Insulin (mIU/L)

End point type	Primary
End point timeframe:	
Follow-up (Day 72). More precisely ISI-M from 2h-(OGTT) is calculated considering the timepoints Basal, 30, 60, 90, 120 minutes and ISI-M from 3h-(OGTT) is calculated considering the timepoints Basal, 10, 20, 30, 60, 90, 120 and 180 minutes.

End point title	Change from baseline to follow-up in Homeostasis Model of
-----------------	---

End point description:

As the trial was exploratory, no primary endpoint was defined.

Homeostasis model assessment of insulin resistance (HOMA-IR) is a method to measure insulin resistance, an early stage of type 2 diabetes that increases the risk of many chronic diseases. The index practically says how much insulin the body needs to keep blood sugar levels in check.

HOMA-IR calculated by [Mari, 2001] is defined as:

$(\text{fasting plasma insulin (mIU/L)} \times \text{fasting plasma glucose (mg/dL)}) / 405$ where fasting plasma glucose (mg/dL) and fasting plasma insulin (mIU/L) are defined as above in the ISI-M formula details.

In general, HOMA-IR values between 0.5 and 1.4 are considered normal, ≥ 1.9 are indicative of early IR, and ≥ 2.9 indicate IR.

End point title	Change from baseline to follow-up in C-peptide area under the curve (AUC) from 3-hours OGTT.
-----------------	--

End point description:

As the trial was exploratory, no primary endpoint was defined.

Area under the curve (AUC) values for plasma C-peptide (CP) concentration/level is a common method to measure beta cell loss in Type 1 diabetes (T1D). CP typically rises in the first weeks to months after diagnosis and then falls over time. Both the starting level of CP, reflecting beta cell reserve, and its rate of decline, indicating disease progression, vary considerably between patients. In the study C-peptide AUC was assessed through 3h-OGTT (meaning that C-peptide AUC was calculated considering the timepoints: Basal, 10 min, 20 min, 30 min, 60 min, 90 min, 120 min, 180 min). More in detail, C-peptide AUC was calculated using the trapezoidal rule.

Other pre-specified: Change from baseline of mean Proinsulin / C-peptide ratio

End point title	Change from baseline of mean Proinsulin / C-peptide ratio
-----------------	---

End point description:

As the trial was exploratory, no primary endpoint was defined.

Proinsulin/C-peptide ratio was calculated using the following formula [Truyen, 2005]:

Proinsulin/C-peptide ratio (%) = $100 \times \text{proinsulin (pmol/l; ELISA)} / [\text{total C-peptide (pmol/l; ECLIA)} - \text{proinsulin (pmol/l; ELISA)}]$.

Note: in this study the method ECLIA (Electrochemiluminescence Immunoassay) was used for the laboratory range of C-peptide, but this was confirmed by the Sponsor to be comparable to the TRFIA (Time Resolved Fluorescence Immunoassay) reported in the paper reference [Truyen, 2005].

Please note: Basal value is defined as the mean of Basal #1 (i.e., 15 min before glucose administration) and Basal #2 (i.e., Time 0, just before glucose administration);

End point type	Other pre-specified
----------------	---------------------

End point timeframe:

Follow-up (Day 72). More precisely Proinsulin / C-peptide ratio is calculated considering the timepoints Basal and 10 min, 20 min, 30 min, 60 min, 90 min, 120 min, 120 and 180 min post-dose.

Other pre-specified: Adverse events

End point title	Adverse events
-----------------	----------------

End point description:

An AE was defined as any untoward medical occurrence in a patient/clinical investigation participant administered a medicinal product and which did not necessarily have a causal relationship with that treatment. An AE could therefore be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of the medicinal product, whether or not considered related to the medicinal product. Any AEs which were considered to be reasonably likely to have been caused by the IMP were considered Adverse Drug Reactions (ADRs). Any AE reported as having had a possible, probable, or highly probable relationship to the study medication qualified as an ADR.

End point type	Other pre-specified
----------------	---------------------

End point timeframe:

AEs were monitored and recorded throughout the study, from the date of informed consent signed (week 0) to the end of study participation (early discontinuation or follow-up visit during week 11 (day 71-75))

End point values	Ladarixin - SAF	Placebo - SAF set

Adverse events

Adverse events information

Timeframe for reporting adverse events:

AEs were monitored and recorded throughout the study, from the date of informed consent signed (week 0) to the end of study participation (early discontinuation or follow-up visit during week 11 (day 71-75))

Adverse event reporting additional description:

All TEAEs were mild or moderate in severity and none led to treatment or study discontinuation. The most frequently reported TEAEs in the ladarixin group were gastrointestinal disorders, most of which were considered ADRs. All ADRs in the ladarixin treatment group were mild in severity and treatment with ladarixin was continued unchanged.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
15 October 2021	Extension of IMP shelf-life from 24 to 36 months.
09 November 2021	Addition of INCO operational unit. INCO stands for Istituto Nazionale di Cura dell'Obesità (National Institute of Obesity Treatment)
07 October 2022	Extension of IMP shelf-life from 36 to 48 months
07 November 2022	Transfer of INCO operational unit from IRCCS Policlinic San Donato to IRCCS Galeazzi Hospital. IRCCS stands for Istituto di Ricovero e Cura a Carattere Scientifico (Scientific Institute for Research, Hospitalization and Healthcare)

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

No limitations or caveats are applicable to this summary of the results

Notes:
