

Clinical trial results:

A Phase 2a, Randomized, Double-Blind, Placebo-Controlled Study to Evaluate the Efficacy and Safety of ANB019 in the Treatment of Acneiform Rash in Subjects with Neoplasm Receiving EGFRi or MEKi Therapy

Summary

EudraCT number	2020-003494-22
Trial protocol	PL CZ LV BG HU
Global end of trial date	13 December 2021

Results information

Result version number	v1 (current)
This version publication date	20 January 2023
First version publication date	20 January 2023

Trial information

Trial identification

Sponsor protocol code	ANB019-207

Notes:

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 December 2021
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	13 December 2021
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

To assess the efficacy of imsidolimab (ANB019) compared with placebo in the reduction of acneiform rash in participants receiving epidermal growth factor receptor inhibitor (EGFRi) or mitogen-activated protein (MAP)/extracellular signal-regulated kinase (ERK) kinase inhibitor (MEKi) therapy as measured by the facial inflammatory lesion count.

Protection of trial subjects:

This study was performed in compliance with ethical principles that have their origin in the Declaration of Helsinki and that are consistent with Good Clinical Practice (GCP) and the applicable laws and regulations.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	04 May 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 1
Country: Number of subjects enrolled	Czechia: 1
Country: Number of subjects enrolled	Georgia: 2
Worldwide total number of subjects	4
EEA total number of subjects	2

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	3

From 65 to 84 years	1
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Participants with neoplasms who were receiving epidermal growth factor inhibitors or mitogen-activated protein/extracellular signal regulated kinase inhibitor were enrolled into the study.

Pre-assignment

Screening details:

11 participants were screened for eligibility and 4 participants were randomized into the study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

Blinding implementation details:

The Sponsor, Investigator, and participants were blinded to treatment assignment of imsidolimab or placebo. An unblinded pharmacist was responsible for study treatment dispensing.

Arms

Are arms mutually exclusive?	Yes
Arm title	Imsidolimab

Arm description:

Participants received a starting dose of 400 milligrams (mg) of imsidolimab on Day 1 followed by 200 mg imsidolimab every 4 weeks (Days 29, 57 and 85) by subcutaneous injection.

Arm type	Experimental
Investigational medicinal product name	Imsidolimab
Investigational medicinal product code	ANB019
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Imsidolimab was administered by clinic staff trained in best practices for subcutaneous administration at starting dose of on Day 1 followed by 200 mg imsidolimab every 4 weeks (Days 29, 57 and 85).

Arm title	Placebo
------------------	---------

Arm description:

Participants received imsidolimab matching placebo on Day 1 and thereafter, every 4 weeks (Days 29, 57 and 85) by subcutaneous injection.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo matched to imsidolimab was administered by clinic staff trained in best practices for subcutaneous administration on Days 1, 29, 57 and 85.

Number of subjects in period 1	Imsidolimab	Placebo
Started	2	2
Completed	0	0
Not completed	2	2
Study termination	2	1
Withdrew consent	-	1

Primary: Change From Baseline in Facial Inflammatory Lesion Count (Papules and Pustules) at Week 8

End point title	Change From Baseline in Facial Inflammatory Lesion Count (Papules and Pustules) at Week 8 ^[1]
End point description:	
The number of facial inflammatory lesions (papules and pustules) on the face (excluding the neck and scalp area) was counted. Papule was a small, solid elevation 5 millimeters (mm) or less in diameter. Pustule was a small, circumscribed elevation of the skin that contains yellow-white exudate.	
Due to early study termination, no participant was evaluated in the imsidolimab group and 1 participant was evaluated in the placebo group. Since only 1 participant was evaluated, results were not reported for the protection of personal data and to avoid re-identification.	
End point type	Primary
End point timeframe:	
Baseline, Week 8	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: No statistical analysis was performed for the primary endpoint. Due to early study termination, no participant was evaluated in the imsidolimab group and 1 participant was evaluated in the placebo group. Since only 1 participant was evaluated, results were not reported for the protection of personal data and to avoid re-identification.

Secondary: Percentage of Participants With an Improvement of at Least 1 Grade From Baseline in Acneiform Rash Common Terminology Criteria for Adverse Events (CTCAE) Grading Scale at Week 8

End point title	Percentage of Participants With an Improvement of at Least 1 Grade From Baseline in Acneiform Rash Common Terminology Criteria for Adverse Events (CTCAE) Grading Scale at Week 8
-----------------	---

End point description:

The acneiform rash CTCAE grading scale of severity was 6-point scale ranging from 0-5.

Scale 0=no evidence of rash.

Scale 1=papules and/or pustules covering <10% body surface area (BSA), which may or may not be associated with symptoms of pruritus or tenderness.

Scale 2=papules and/or pustules covering 10-30% BSA, which may or may not be associated with symptoms of pruritus

or tenderness; associated with psychosocial impact; limiting instrumental activities of daily living (ADL); papules and/or

pustules covering >30% BSA with or without mild symptoms.

Scale 3=papules and/or pustules covering >30% BSA with moderate or severe symptoms; limiting self-care ADL;

associated with local superinfection with oral antibiotics.

Scale 4=life-threatening consequences; papules and/or pustules covering any %BSA, which may or may not be

associated with symptoms of pruritus or tenderness and are associated with extensive superinfection with intravenous

(IV) antibiotics indicated.

Scale 5=death

Secondary: Percentage of Participants With an Improvement of at Least 1 Grade From Baseline in Acneiform Rash Modified Multinational Association for Supportive Care in Cancer (MASCC) EGFRi Skin Toxicity Tool (MESTT) Grading Scale (Total Score) at Week 8

End point title	Percentage of Participants With an Improvement of at Least 1
-----------------	--

End point description:

The MESTT grading scale of the acneiform rash severity was a 3-point scale ranging from 1 to 3:
 Scale 1 = 1A: papules or pustules ≤5; OR 1 area of erythema or edema <1 centimeter (cm) in size. 1B: papules or pustules ≤5; OR 1 area of erythema or edema <1 cm in size; AND pain or pruritus.
 Scale 2 = 2A: papules or pustules 6-20; OR 2-5 areas of erythema or edema <1 cm in size. 2B: Papules or pustules 6-20; OR 2-5 areas of erythema or edema <1 cm in size; AND pain, pruritus, or effect on emotions or functioning.
 Scale 3 = 3A: papules or pustules > 20; OR more than 5 areas of erythema or edema <1 cm in size. 3B: papules or pustules > 20; OR more than 5 areas of erythema or edema <1 cm in size; AND pain, pruritus, or effect on emotions or functioning.
 Grading was performed individually for the face, scalp, chest, and back. The sum of all body region scores yielded the total score (range: 4 to 12).

Secondary: Change From Baseline in Functional Assessment of Cancer Therapy - Epidermal Growth Factor Receptor Inhibitor 18 (FACT-EGFRI-18) at Week 8

End point title	Change From Baseline in Functional Assessment of Cancer Therapy - Epidermal Growth Factor Receptor Inhibitor 18 (FACT-EGFRI-18) at Week 8
-----------------	---

End point description:

The FACT-EGFRI-18 was an 18-item likert-scaled questionnaire, arranged in three dimensions: physical (seven items), social/emotional (six items), and functional well-being (five items). The response scores ranged from 0 (not at all) to 4 (very much).

The total score was obtained by multiplying the sum of the subscale by the number of items in the scale (18), and then dividing by the number of items actually answered.

The total score ranged from 0-72 with a higher score represented a high level of symptomatology (problems).

Due to early study termination, no participant was evaluated in the imsidolimab group and 1 participant was evaluated in the placebo group. Since only 1 participant was evaluated, results were not reported for the protection of personal data and to avoid re-identification.

End point title	Number of Participants With Treatment-Emergent Adverse Events
-----------------	---

End point description:

An adverse event (AE) was any untoward medical occurrence in a participant temporally associated with the use of a study treatment, whether or not considered related to study treatment. An AE could therefore be any unfavorable and unintended sign (including abnormal laboratory finding), symptom, or disease temporally associated with use of study treatment that did not necessarily have a causal relationship with this treatment. An AE was considered "serious" if there was any of the following outcomes: death, life-threatening, Inpatient hospitalization or prolongation of existing hospitalization, persistent or significant incapacity or substantial disruption of ability to conduct normal life functions, congenital anomaly/birth defect, other important medical events. An AE was considered treatment-emergent if the date of onset was during or after first dose of study treatment, or if the AE present at baseline worsened in either intensity or frequency after first dose of study treatment.
