

Clinical trial results:

Randomized, controlled, multi-center trial to evaluate the efficacy and safety of a Loxoprofen sodium 60 mg medicated plaster vs. placebo and vs. a marketed comparator in the local symptomatic and short term treatment of pain in acute strains, sprains or bruises of the muscles or joints following blunt trauma, e.g. sports injuries.

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	06 February 2024
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	30 June 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the efficacy of a Loxoprofen sodium 60 mg medicated plaster applied once a day compared with placebo and a marketed active comparator in patients with acute blunt, soft tissue injuries of the muscles or joints.

Protection of trial subjects:

This clinical study was designed and was implemented and reported in accordance with the ICH Harmonized Tripartite Guidelines for Good Clinical Practice E6 (R2) [European Medicines Agency 2016], with applicable local regulations (including European Directive 2001/20/EC, US Code of Federal Regulations Title 21, and Japanese Ministry of Health, Labor, and Welfare), and with the ethical principles laid down in the Declaration of Helsinki. Eligible patients were only to be included in the study after providing written (witnessed, where required by law or regulation), IRB/IEC/REB-approved informed consent, or, if incapable of doing so, after such consent had been provided by a legally acceptable representative of the patient. In cases where the patient's representative had given consent, the patient had to be informed about the study to the extent possible given his/her understanding. Patients less than 18 years of age were also required to provide the consent of both legal guardians. If the patient was capable of doing so, he/she was to indicate assent by personally signing and dating the written informed consent document or a separate assent form. Informed consent was obtained before conducting any study-specific procedures (i.e., all of the procedures described in the protocol). The process of obtaining informed consent was documented in the patient source documents. Women of child bearing potential were informed that taking the study medication could have involved unknown risks to the fetus if pregnancy occurred during the study and agreed that in order to participate in the study, they adhered to the contraception requirement for the duration of the study. If there was any question that the patient would not reliably comply, they have not been entered in the study.

Background therapy:

Concomitant therapies allowed during the study:

- Rescue medication (paracetamol, 500 mg tablets) except for the 6 hours prior to visit 5 (72h).
- Standard care by rest, ice, compression (non-occlusive bandage), or elevation (RICE) could have been considered at the discretion of the Investigator.

Concomitant therapies prohibited during the study:

- Use of systemic or topical NSAIDs (other than study treatment), analgesics (other than paracetamol), opioids, corticosteroids (except for topical treatment of bronchial asthma), heparin, or psychotropic agents.

The Investigator instructed the patient to notify the study center about any new medications and significant non-drug therapies (i.e., RICE) he/she took after the start of the study drug. All medications and significant non-drug therapies taken during the 30 days prior to Visit 1 (0h, Day 1) (including physical therapy and blood transfusions) or administered after the patient started treatment with study drug were listed on the Concomitant medications/Significant non-drug therapies CRF page. An AE CRF page was also completed, if appropriate.

Evidence for comparator:

-

Actual start date of recruitment	15 June 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 257
Worldwide total number of subjects	257
EEA total number of subjects	257

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	5
Adults (18-64 years)	250
From 65 to 84 years	2
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Overall, 257 patients (123 female and 134 male) suffering from acute sports-related soft-tissue injury/contusion of the upper or lower limb were randomised. In total 256 out of 257 study participants (99.61 %) were Caucasian.

The trial was performed in 5 centers in Germany.

Pre-assignment

Screening details:

Subjects were eligible for enrollment according to the trial inclusion and exclusion criteria.

Period 1

Period 1 title	Intervention (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst, Assessor

Blinding implementation details:

Double-blind study with respect to the loxoprofen sodium + placebo plaster. Patients, investigator staff, assessors, monitors and data analysts remained blinded to the identity of these treatments from the time of randomization until database lock. With respect to the active comparator, patients and investigators could not have been fully blinded due to a difference in appearance of the active comparator. Measures were put in place to avoid awareness of treatment allocation.

Arms

Are arms mutually exclusive?	Yes
Arm title	Loxoprofen sodium 60 mg medicated plaster

Arm description:

Loxoprofen sodium 60 mg medicated plaster was applied to the injured site once a day for up to 7 days (maximum of 7 plasters).

Arm type	Experimental
Investigational medicinal product name	Loxoprofen sodium 60 mg medicated plaster
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Transdermal patch
Routes of administration	Cutaneous use, Local use , Transdermal use

Dosage and administration details:

In the Loxoprofen treatment group, patients applied 1 medicated plaster (Loxoprofen, 60 mg loxoprofen sodium) every 24 hours for a total of 7 days, resulting in 7 applications of 60 mg loxoprofen sodium each. This adds up to an exposure of 7 x 60 mg, resulting in 420 mg loxoprofen sodium over 7 days.

Arm title	Placebo
------------------	---------

Arm description:

Placebo plaster that did not contain the active ingredient as well as the excipient phosphoric acid, but was otherwise indistinguishable from the investigational drug Loxoprofen sodium 60 mg medicated plaster.

Arm type	Placebo
Investigational medicinal product name	Placebo plaster
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Transdermal patch
Routes of administration	Cutaneous use, Local use , Transdermal use

Dosage and administration details:

Placebo plaster was applied to the injury site once a day for up to 7 days (maximum of 7 plasters).

Arm title	Active comparator
Arm description: Nurofen 24-Stunden Schmerzplaster containing 200 mg Ibuprofen each was used as marketed active comparator and was applied to the injured site once a day for up to 7 days.	
Arm type	Active comparator
Investigational medicinal product name	Nurofen 24-Stunden Schmerzplaster
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Transdermal patch
Routes of administration	Cutaneous use, Local use , Transdermal use

Dosage and administration details:

In the Nurofen 24-Stunden Schmerzplaster group, patients applied 1 medicated plaster (200 mg ibuprofen) every 24 hours for a total of 7 days, resulting in 7 applications of 200 mg ibuprofen each. This adds up to an exposure of 7 x 200 mg, resulting in 1400 mg ibuprofen over 7 days.

Reporting group description: Nurofen 24-Stunden Schmerzpfaster containing 200 mg Ibuprofen each was used as marketed active comparator and was applied to the injured site once a day for up to 7 days.	
Subject analysis set title	Full Analysis Set (FAS)
Subject analysis set type	Full analysis
Subject analysis set description: The Full Analysis Set (FAS) was all randomized patients who received at least one dose of study drug. The FAS population was primary population for the analysis of efficacy. Any exclusions from the FAS population were made and documented before unblinding (e.g. never used study medication, randomized twice). Additional secondary populations could have been defined before unblinding.	

Primary: Pain-on-movement (POM) change from baseline (pain intensity difference = PID) to Visit 5

End point title	Pain-on-movement (POM) change from baseline (pain intensity difference = PID) to Visit 5
End point description: Pain-on-movement (POM) served as primary efficacy outcome and was assessed by Visual Analogue Scale (VAS). At each study visit POM was induced by the same standardised movement, and/or investigator-derived passive manipulation of the nearest joint. The primary efficacy variable was the change from baseline in pain-on-movement (POM) assessed at Visit 5 (72 h after initiating treatment); i.e., pain intensity difference (PID). From POM values the PID was calculated by subtracting POM VAS from baseline, so that greater negative PID values indicate greater pain reduction.	
End point type	Primary
End point timeframe: Pain-on-movement (POM) was assessed at Visit 5 (72 hours after initiating treatment). From POM values the PID was calculated by subtracting POM VAS from baseline, so that greater negative PID values indicate greater pain reduction.

Statistical analysis title	Treatment vs. active comparator
Comparison groups	Loxoprofen sodium 60 mg medicated plaster v Active comparator
Number of subjects included in analysis	192
Analysis specification	Pre-specified
Analysis type	non-inferiority
P-value	= 0.3057
Method	ANCOVA
Confidence interval	
level	95 %
sides	2-sided
lower limit	-108.51
upper limit	344.67

Statistical analysis title	Active comparator vs. placebo
Comparison groups	Placebo v Active comparator
Number of subjects included in analysis	129
Analysis specification	Pre-specified
Analysis type	superiority
P-value	< 0.0001
Method	ANCOVA
Confidence interval	
level	95 %
sides	2-sided
lower limit	-832.4
upper limit	-314.17

Adverse events

Adverse events information

Timeframe for reporting adverse events:

The occurrence of AEs was sought by non-directive questioning of the patient at each visit during the study.

Adverse event reporting additional description:

AEs could have been detected when they were volunteered by the patient during/between visits or through physical examination or other assessments.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 March 2022	Substantial amendment to move investigator site 04 to new premises.
19 August 2022	Addition of a new investigator at site 05.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

None reported
