

## Clinical trial results:

### Efficacy of erenumab in chronic cluster headache: A 10-week double-blind, randomized, placebo-controlled, multicentric trial

#### Summary

EudraCT number	2020-004399-16
Trial protocol	DE
Global end of trial date	27 September 2023

#### Results information

Result version number	v1 (current)
This version publication date	17 November 2024
First version publication date	17 November 2024

#### Trial information

##### Trial identification

Sponsor protocol code	CHERUB01
-----------------------	----------

##### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	NCT04970355
WHO universal trial number (UTN)	-

Notes:

Scientific contact	Projectmanager, Charité - Universitätsmedizin Berlin, +49 30450 660 139, ma.lorenz@charite.de

Notes:

##### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	07 June 2024
Is this the analysis of the primary completion data?	Yes
Primary completion date	27 September 2023
Global end of trial reached?	Yes
Global end of trial date	27 September 2023
Was the trial ended prematurely?	Yes

Notes:

## General information about the trial

Main objective of the trial:

The primary objective of this study is to test the hypothesis that erenumab is superior to placebo in the reduction of weekly CH attacks in weeks 5 and 6 (days 29-42) in the erenumab group compared to placebo versus baseline

Protection of trial subjects:

The conduct of this study met all legal and regulatory requirements and in accordance with ethical principles of the Declaration of Helsinki.

Background therapy:

About 30% of all cluster headache patients suffer from chronic cluster, i.e. in one year, they are not experiencing more than 3 months without cluster headache attacks. . Erenumab has a marketing authorization for the prophylactic treatment of adult patients with diagnosed migraine (70mg/140mg). It is and was not authorized for the prophylaxis and/or treatment of chronic cluster headache. Two other CGRP monoclonal antibodies (galcanezumab / fremanezumab) were investigated in different double-blind placebo controlled clinical trials, but failed to show any efficacy in the prophylaxis of chronic cluster headache. Only Lithium has a regulatory approval for the prophylaxis of cCH, but other treatments such as Verapamil, Topiramate and Corticosteroids are currently used (off-label) alone or in combination. For treatment of acute headache attacks, treatments such as sumatriptan s.c. or zolmitriptan nasal spray can be used. Furthermore, Oxygen is also used by patients.

The pathophysiological similarities between migraine and cluster headache as primarily unilateral trigeminal headache disorders, the role of CGRP in both disorders and the clinical efficacy observed with erenumab to date for the prevention of migraine support the evaluation of erenumab for the treatment of cluster headache. This study was conducted with a CGRP (Calcitonin Gene-Related Peptide) monoclonal antibody named erenumab (Aimovig®).

Prophylactic pharmacological treatments of chronic cluster headache (cCH) are limited. Blocking the Calcitonin Gene-Related Peptide (CGRP) receptor might represent a specific new treatment based on pathophysiological evidence. This proof-of-concept study assessed the efficacy and tolerability of the CGRP receptor antibody erenumab in cCH.

Evidence for comparator: -

Actual start date of recruitment	02 December 2021
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Germany: 81
Worldwide total number of subjects	81
EEA total number of subjects	81

Notes:

<b>Subjects enrolled per age group</b>	
In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	81
From 65 to 84 years	0
85 years and over	0

## Subject disposition

### Recruitment

Recruitment details:

The study was conducted at 11 study centers in Germany, between 02/12/2021 and 27/09/2023.

### Pre-assignment

Screening details:

101 patients were screened according the inclusion criteria (at least 9 cluster attacks as defined by ICHD-3 in 7 days during the baseline epoch (SPII), Attacks must have occurred on more than 50% of days of the baseline epoch,  $\geq 90\%$  patient-reported eDiary compliance during the Baseline epoch) 81 of whom were randomized.

### Period 1

Period 1 title	overall trial (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Monitor, Data analyst

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Verum

Arm description:

Erenumab is a monoclonal antibody (mab) that blocks the CGRP receptor. The dosage of 280mg s.c. erenumab as a loading dose and a continuing dosage of 140mg s.c. erenumab after 28 days was based on the pharmacodynamical considerations of the Novartis pharmacological experts. PK-exposure response modelling suggests that with higher doses, a potential additional benefit in terms of efficacy and onset of efficacy might be observed. The estimation was that the cluster headache population obtain an additional benefit from a loading dose with a faster reach of drug steady state.

Arm type	Experimental
Investigational medicinal product name	Erenumab
Investigational medicinal product code	
Other name	Aimovig®
Pharmaceutical forms	Suspension for injection in pre-filled syringe
Routes of administration	Subcutaneous use

Dosage and administration details:

280mg s.c. loading dose at Visit 2 (week 0) in 4x pre-filled syringes of 1 ml each with 70mg Erenumab 140mg s.c. at Visit 3 (4 weeks after first application) with 2x pre-filled syringes á 70mg/1ml

6 weeks, with two dose applications at Visit 2 (week 0) and Visit 4 (week 4)

<b>Arm title</b>	Placebo
------------------	---------

Arm description:

Trial medication (IMP and Placebo) was provided by the Funder Novartis. The pre-filled syringes of IMP and Placebo were completely identical. There were no differences regarding look, smell or other factors.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code

### Statistical analyses

Statistical analysis title	Change of weekly cluster headache attacks
Statistical analysis description: Bayesian method used for this Proof of Concept. Methods used was suggested by Fish et al. (Fish et al., 2015); Using non-informative prior distributions, we obtained samples from the posterior distribution of the differences in change from baseline between erenumab and placebo. For sampling from the posterior distribution, we used the STAN software with the default, weakly informative prior.

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 May 2021	Update: CT application form, Labelling, Trial protocol (V02, 15-3-2021) Changes in conduct or management of the trial (SARS-CoV-2 Antigen testing, Discontinuation of study treatment by new onset of SARS-CoV-2 Infection as determined at any of the study visits, remote-Site monitoring during pandemic)
13 June 2022	Update: CT application form, trial protocol and synopsis (V03,30-04-2022), Patient information (ICF V03), SmPc Aimovig 12/21, Changes in safety or integrity of trial subjects, Changes in conduct or management of the trial
28 February 2023	Update: CT application form, trial protocol and synopsis (V04, 18-01-23); Changes in safety or integrity of trial subjects, Changes in conduct or management of the trial

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

We did not find a sufficient number of patients in the allocated time period and therefore stopped recruitment prematurely. The result is very clearly negative and the addition of the missing subjects would not have changed anything to results.

Notes:
