General information about the trial

Main objective of the trial:

The primary objective was to assess the safety and tolerability of intravenous (IV) OAV101 over a 12-month period in participants with SMA weighing ≥ 8.5 kg to ≤ 21 kg.

Protection of trial subjects:

The study was in compliance with the ethical principles derived from the Declaration of Helsinki and the International Conference on Harmonization (ICH) Good Clinical Practice (GCP) guidelines. All the local regulatory requirements pertinent to safety of trial subjects were also followed during the conduct of the trial.

Recruitment

Recruitment details:

Participants took part in 13 investigative sites across 9 countries.

Pre-assignment

Screening details:

The screening period began after signature of the study informed consent. The study included a screening period of up to 45 days. On Day -1, participants were admitted to the hospital for pre-treatment baseline procedures. On Day 1, participants received the study treatment.

Secondary: Achievement of development motor milestones according to the modified and combined WHO-MGRS and Bayley scale of Infant and Toddler Development.

End point title	Achievement of development motor milestones according to the modified and combined WHO-MGRS and Bayley scale of Infant and Toddler Development.
-----------------	---

End point description:

The World Health Organization-Multicentre Growth Reference Study (WHO-MGRS) and Bayley scale of Infant and Toddler Development was modified and combined into a single scale expressly for this study, to measure developmental motor milestones. These were assessed via the milestone checklist, formed of 10 yes/no questions with optional video documentation. The developmental milestones are: head control, sitting with support, sitting without support, sitting without support for 30 seconds, hands-and-knees crawling, pulls to stand, standing with assistance, walking with assistance, standing alone and walking alone. A yes response indicates that the patient reached a particular development milestone.

End point description:

The HFMSE was devised for use in children with SMA to give objective information on motor ability and clinical progression. The HFMSE is formed of 33 assessments. End point title	Change from baseline in Revised Upper Limb Module (RULM), as appropriate according to participant age.
-----------------	--

End point description:

The RULM assesses motor performance in the upper limbs from childhood through adulthood in ambulatory and non-ambulatory individuals with SMA. The scale consists of an entry item to establish functional levels and 19 items covering distal to proximal movements. The entry item is a modified version of the Brooke scale, including activities ranging from no functional use of hands (score 0) to full bilateral shoulder abduction (score 6). The entry item does not contribute to the total score but serves as a functional classification of overall upper limb functional ability. Of the remaining 19 items, 18 are scored on a 3 point scoring system and 1 item is scored on a 2 point scoring system. The test is performed unilaterally using the limb preferred by the participant. The total score ranges from 0, if all the items cannot be performed, to 37, if all the activities are achieved fully without any compensation. Higher scores indicate higher levels of motor ability.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
28 February 2022	The main purpose of the amendment was to remove virus serology form time points past screening in the Schedule of Assessments. Other changes included adding complement panel, optional pharmacogenetics and ACEND assessment as exploratory endpoints. In addition, protocol was edited for consistency and clarification purposes.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No
