Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	Yes
EMA paediatric investigation plan number(s)	EMA-002677-PIP01-19
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	16 August 2023
Is this the analysis of the primary completion data?	No
Global end of trial reached?	Yes
Global end of trial date	16 August 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The primary objectives of this study are the assessments of the safety and efficacy of intravenous administration of delandistrogene moxeparvovec (SRP-9001) in Duchenne muscular dystrophy participants.

Protection of trial subjects:

Written informed consent from each participant or participant's parent(s) or legal guardian(s), if applicable, and written assent from each participant, if applicable, were obtained before any study-specific screening or baseline period evaluations were performed. The anonymity of participating participant will be maintained to the extent required by applicable laws and in accordance with current Health Insurance Portability and Accountability Act (HIPAA) standards. This study was designed and monitored in accordance with Sponsor procedures, which complied with the ethical principles of Good Clinical Practice (GCP) as required by the major regulatory authorities, and in accordance with the Declaration of Helsinki.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	05 December 2018
Long term follow-up planned	Yes
Long term follow-up rationale	Safety, Efficacy
Long term follow-up duration	5 Years
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	United States: 41
Worldwide total number of subjects	41
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0

Children (2-11 years)	41
Adolescents (12-17 years)	0
Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

This was a 3-part clinical study of a single dose of delandistrogene moxeparvovec. Participants were randomized to receive delandistrogene moxeparvovec in one of two 48-week periods (Part 1 or Part 2) via a crossover study design. Part 3 was an open-label follow up.

Pre-assignment

Screening details:

No participants were excluded as all randomized participants received study drug in either Part 1 or Part 2.

Period 1

Period 1 title	Part 1 - Double Blind
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Investigator, Carer, Assessor, Subject

Arms

Are arms mutually exclusive?	Yes
Arm title	Delandistrogene Moxeparvovec Switched Over to Placebo

Arm description:

Participants received delandistrogene moxeparvovec at Part 1 followed by placebo at Part 2 followed by an open-label extension at Part 3. No intervention was administered during Part 3.

Arm type	Experimental
Investigational medicinal product name	delandistrogene moxeparvovec
Investigational medicinal product code	SRP-9001
Other name	SRP-9001, delandistrogene moxeparvovec-rokl, ELEVIDYS
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Single intravenous (IV) infusion

Arm title	Placebo Switched Over to Delandistrogene Moxeparvovec
------------------	---

Arm description:

Participants received placebo at Part 1 followed by delandistrogene moxeparvovec at Part 2 followed by an open-label extension at Part 3. No intervention was administered during Part 3.

Arm type	Experimental
Investigational medicinal product name	Placebo
Investigational medicinal product code	Placebo
Other name	Lactated Ringer's solution
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Single IV infusion

Number of subjects in period 1	Delandistrogene Moxeparvovec Switched Over to Placebo	Placebo Switched Over to Delandistrogene Moxeparvovec
Started	20	21
Received At Least 1 Dose Of Study Drug	20	21
Completed	20	21

Period 2

Period 2 title	Part 2 - Double Blind
Is this the baseline period?	No
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator, Carer, Assessor

Arms

Are arms mutually exclusive?	Yes
Arm title	Delandistrogene Moxeparvovec Switched Over to Placebo

Arm description:

Participants received delandistrogene moxeparvovec at Part 1 followed by placebo at Part 2 followed by an open-label extension at Part 3. No intervention was administered during Part 3.

Arm type	Experimental
Investigational medicinal product name	Placebo
Investigational medicinal product code	Placebo
Other name	Lactated Ringer's solution
Pharmaceutical forms	Solution for infusion
Routes of administration	Intravenous use

Dosage and administration details:

Single IV infusion

Arm title	Placebo Switched Over to Delandistrogene Moxeparvovec
------------------	---

Arm description:

Participants received placebo at Part 1 followed by delandistrogene moxeparvovec at Part 2 followed by an open-label extension at Part 3. No intervention was administered during Part 3.

Arm type	Experimental
Investigational medicinal product name	delandistrogene moxeparvovec
Investigational medicinal product code	SRP-9001
Other name	SRP-9001, delandistrogene moxeparvovec-rokl, ELEVIDYS

Subject analysis set description:

All participants who received study treatment during Part 1 or Part 2, with treatment group designated according to the treatment that they actually received.

Primary: Change From Baseline at Week 12 in Quantity of Delandistrogene Moxeparvovec Dystrophin Protein Expression as Measured by Western Blot Adjusted by Muscle Content

End point title	Change From Baseline at Week 12 in Quantity of Delandistrogene Moxeparvovec Dystrophin Protein Expression as Measured by Western Blot Adjusted by Muscle Content
-----------------	--

End point description:

Baseline muscle biopsies with ultrasound guidance were performed pre-treatment and post-treatment (Week 12) on all participants. The change from baseline in delandistrogene moxeparvovec dystrophin expression in these muscle biopsy samples was determined by Western Blot. Dystrophin protein was measured and then adjusted based on the percentage of muscle content in the biopsy sample. An increase in protein expression indicates production of the delandistrogene moxeparvovec dystrophin protein. Reported results based upon the ITT Population: all randomized participants who received study treatment during Part 1.

Primary: Change From Baseline at Week 48 in NSAA Total Score

End point title	Change From Baseline at Week 48 in NSAA Total Score
End point description:	
<p>The NSAA is a healthcare provider administered scale that rates performance of various motor abilities in ambulant children with Duchenne Muscular Dystrophy and is used to monitor disease progression and treatment effects. During assessment, participants are asked to perform 17 different functional activities that are graded as: 2 - "Normal" - no obvious modification of activity; 1 - Modified method but achieves goal independent of assistance; 0 - Unable to achieve independently. The NSAA total score is defined as the sum of all 17 items, ranging from 0 (worst) to 34 (best). The response vector consists of the change from baseline in NSAA total score at the post-baseline visit. The model includes the covariates of treatment group, visit, treatment group by visit interaction, age group, baseline NSAA total score, and baseline NSAA total score by visit interaction. All covariates are fixed effects in this analysis. An increase in score indicates an improvement in motor function.</p>

Secondary: Participants Experiencing Adverse Events (AEs) Since Treatment with Delandistrogene Moxeparvovec

End point title	Participants Experiencing Adverse Events (AEs) Since Treatment with Delandistrogene Moxeparvovec
-----------------	--

End point description:

Participants experiencing AEs are reported based upon the time to AE onset after delandistrogene moxeparvovec infusion. Each analysis set includes data from both arms and is based upon the Delandistrogene Moxeparvovec-treated Population: all participants who were treated with delandistrogene moxeparvovec in Part 1 or Part 2.

'Delandistrogene Moxeparvovec switched over to Placebo' participants received delandistrogene moxeparvovec in Part 1, followed by placebo in Part 2. AEs experienced by participants during Parts 1, 2, and 3 of the study are reported.

'Placebo switched over to Delandistrogene Moxeparvovec' participants received placebo in Part 1, followed by delandistrogene moxeparvovec in Part 2. AEs experienced by participants during Parts 2 and 3 of the study are reported.

No intervention was administered during Part 3.

A summary of serious and all other non-serious AEs regardless of causality is located in the Reported Adverse Events module.

End point description: The NSAA is a healthcare provider administered scale that rates performance of various motor abilities in ambulant children with Duchenne Muscular Dystrophy and is used to monitor disease progression and treatment effects. During assessment, participants are asked to perform 17 different functional activities that are graded as: 2 - "Normal" - no obvious modification of activity; 1 - Modified method but achieves goal independent of assistance; 0 - Unable to achieve independently. The NSAA total score is defined as the sum of all 17 items, ranging from 0 (worst) to 34 (best). The response vector consists of the change from baseline in NSAA total score at the post-baseline visit. The model includes the covariates of treatment group, visit, treatment group by visit interaction, age group, baseline NSAA total score, and baseline NSAA total score by visit interaction. All covariates are fixed effects in this analysis. An increase in score indicates an improvement in motor function.	
End point type	Other pre-specified
End point timeframe: Baseline, Week 48 (Part 1)	

End point values	Delandistrogen e Moxeparvovec Switched Over to Placebo	Placebo Switched Over to Delandistrogen e Moxeparvovec

Adverse events

Adverse events information

Timeframe for reporting adverse events:

Day 1 through Week 130

Adverse event reporting additional description:

This was a 3-part clinical study of a single dose of delandistrogene moxeparvovec. Participants were randomized to receive delandistrogene moxeparvovec in one of two 48-week periods (Part 1 or Part 2) via a crossover study design. Part 3 was an open-label follow up. All reported adverse events are based upon the Safety Population.

Assessment type	Systematic

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
04 June 2019	- Increased the sample size from 24 participants to 44 participants in order to increase the power of the study regarding the NSAA end point. Note: This amendment (Amendment 3) was internally finalized on 04 June 2019 and was sent to sites; however, this amendment was not implemented or submitted to any regulatory agency. Before submitting to the Food and Drug Administration, the Sponsor decided that additional changes were needed, and since the site had already received a version labeled Amendment 3, to avoid confusion the updated version was labeled Amendment 4 when submitted and included additional changes.
02 July 2019	- Removed the requirement to use an enzyme-linked immunospot assay as a means of guiding the post-infusion steroid taper - Updated the sample size determination text - Added a Week 10 visit to both parts of the study
25 September 2019	- Elevated the assessment of ambulatory function as measured by NSAA (total score) to a co-primary end point - Updated language around steroid dose tapering - Added language regarding adverse events of special interest - Clarified the dose concentration to align with the Investigator's Brochure and added explanation of the update to the quantitative polymerase chain reaction method for titering (Sponsor's method using a linear standard)
27 August 2020	- Extended the long-term safety follow-up to 5 years and split the study into 3 parts (two 48-week double-blind periods and one open-label follow-up period) - Defined evaluation of delandistrogene moxeparvovec dystrophin expression from delandistrogene moxeparvovec at 12 weeks post-dosing and effect of delandistrogene moxeparvovec on physical functional assessments as assessed by the NSAA as primary end points (instead of co-primary) - Added a long-term safety and efficacy objective with corresponding end points for Part 3 (open-label extension) of the study
12 April 2023	- Provided participants in Part 3 of the study with the option of continuing their follow-up in a long-term extension study. The long-term extension study was designed to provide a uniform approach to monitoring long-term safety and efficacy in participants who received an infusion of delandistrogene moxeparvovec in a clinical trial. Participants must have completed the Week 130 visit at a minimum before rolling over into the long-term extension study. After completion of the Week 130 visit, if participants decided not to continue their follow-up in the long-term extension study, participants completed an end of study visit.

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? No

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

Caution should be taken in interpreting the treatment effect on the 6-7 years-old age group due to differences in baseline prognostic functional characteristics for certain assessments in treated versus placebo in Part 1.
