Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	13 March 2023
Is this the analysis of the primary completion data?	No

Global end of trial reached?	Yes
Global end of trial date	13 March 2023
Was the trial ended prematurely?	Yes

Notes:

General information about the trial

Main objective of the trial:

The objective of this study was to evaluate the efficacy, safety, pharmacodynamics and pharmacokinetics of gantenerumab treatment compared with placebo in cognitively unimpaired participants, at risk for or at the earliest stages of Alzheimer's Disease (AD).

Protection of trial subjects:

All study participants and the study partners were required to read and sign an informed consent form (ICF).

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	19 April 2022
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Australia: 1
Country: Number of subjects enrolled	Canada: 2
Country: Number of subjects enrolled	United States: 22
Worldwide total number of subjects	25
EEA total number of subjects	0

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	1
From 65 to 84 years	24

85 years and over	0
-------------------	---

Subject disposition

Recruitment

Recruitment details:

Participants took part in this study at 12 investigative centers in Australia, Canada, and the United States from 19 April 2022 to 13 March 2023.

Pre-assignment

Screening details:

A total of 25 amyloid-positive, cognitively unimpaired participants at risk for or at the earliest stages of AD were randomized in a 1:1 ratio to receive either gantenerumab or placebo in this study.

Period 1

Period 1 title	Overall Study (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Double blind
Roles blinded	Subject, Investigator

Arms

Are arms mutually exclusive?	Yes
Arm title	Placebo

Arm description:

Participants received placebo subcutaneous (SC) injection for a maximum of 191 days. Participants had the option to choose between every week (Q1W) or every two weeks (Q2W) dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received placebo, SC every 4 weeks (Q4W) six times, and then Q2W six times, prior to reaching the target dose of Q1W. Participants who chose the Q2W dosing regimen received placebo, SC Q4W nine times, prior to reaching the target dose of Q2W. By the time the study was terminated, none of the participants had reached the target dose.

Arm type	Placebo
Investigational medicinal product name	Placebo
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Placebo SC injection administered for a maximum of 191 days. Participants had the option to choose between Q1W or Q2W dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received placebo, SC Q4W six times, and then Q2W six times, prior to reaching the target dose of Q1W. Participants who chose the Q2W dosing regimen received placebo, SC Q4W nine times, prior to reaching the target dose of Q2W. By the time the study was terminated, none of the participants had reached the target dose.

Arm title	Gantenerumab
------------------	--------------

Arm description:

Participants received gantenerumab SC injection for a maximum of 172 days. Participants had the option to choose between Q1W or Q2W dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received a dose of gantenerumab 120 milligrams (mg) SC Q4W three times, 255 mg SC Q4W three times, and 255 mg SC Q2W six times, prior to reaching the target dose of 255 mg Q1W (i.e., 1020 mg per month). Participants who chose the Q2W dosing regimen received a dose of gantenerumab 120 mg SC Q4W three times, 255 mg SC Q4W three times, and 510 mg SC Q4W three times, prior to reaching the target dose of 510 mg Q2W (i.e., 1020 mg per month). By the time the study was terminated, none of the participants had reached the target dose.

Arm type	Experimental
----------	--------------

Investigational medicinal product name	Gantenerumab
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Solution for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

Gantenerumab SC injection administered for a maximum of 172 days. Participants had the option to choose between Q1W or Q2W dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received a dose of gantenerumab 120 mg SC Q4W three times, 255 mg SC Q4W three times, and 255 mg SC Q2W six times, prior to reaching the target dose of 255 mg Q1W (i.e., 1020 mg per month). Participants who chose the Q2W dosing regimen received a dose of gantenerumab 120 mg SC Q4W three times, 255 mg SC Q4W three times, and 510 mg SC Q4W three times, prior to reaching the target dose of 510 mg Q2W (i.e., 1020 mg per month). By the time the study was terminated, none of the participants had reached the target dose.

Primary: Change from Baseline in PACC-5 Score

End point title	Change from Baseline in PACC-5 Score ^[1]
End point description:	
PACC-5 is computed as the average of z-scores of following cognitive measures: 1. WMS LM I-II - Total Score LM II Delayed Recall; 2. Free & Cued Selective Reminding Test (FCSRT) -Immediate & Delayed Recall - Trials 1-3: Total Recall; 3. Wechsler Adult Intelligence Scale (WAIS) -IV Coding - Total Raw Score; 4. Mini Mental State Examination (MMSE) - Total Score; 5. Category Fluency Test (CFT) - 3 categories - Vegetables, Fruits & Animals - Total Admissible Words. z-score was defined as difference between the assessment and the mean of baseline assessments, divided by standard deviation of baseline assessments. Z-scores range from -3to+3 with higher scores indicating better cognitive performance. Intent-to-Treat (ITT) Population included all participants randomly assigned to study treatment. Participants were grouped into two arms (placebo or gantenerumab) according to treatment assigned at randomization. Overall number analyzed=number of participants with data available for analyses.	
End point type	Primary

Secondary: Time to Onset of Confirmed Clinical Progression

End point title	Time to Onset of Confirmed Clinical Progression
-----------------	---

End point description:

Time to onset of confirmed clinical progression=time from randomization to first occurrence of two consecutive visits(approximately 6 months apart)with a Clinical Dementia Rating Global Score(CDR-GS) of >0. CDR=clinician reported (ClinRO)measure for staging severity of AD dementia based on semi-structured interview with participant &reliable informant. CDR characterizes participant's level of cognitive &functional impairment across six domains (memory/orientation/judgment&problem solving/community affairs/home & hobbies/personal care) on a 5-point rating. CDR-GS is calculated using Washington University CDR-assignment algorithm &characterizes a participant's level of global impairment/stage of dementia according to following categories: 0=normal;0.5=very mild dementia;1=mild dementia;2=moderate dementia;3=severe dementia. Score range=0 to 3.High score=high disease severity. Data was not estimable as no participants had two consecutive visits (approx. 6 months apart) with a CDR-GS >0.

Secondary: Change from Baseline in the Cognitive Function Instrument Acute (CFIa) Participant Version

End point title	Change from Baseline in the Cognitive Function Instrument Acute (CFIa) Participant Version
-----------------	--

End point description:

The CFIa is an outcome measure developed to assess memory-related cognitive and functional decline in non-demented elderly individuals. The CFIa is a modified version of the original CFI and differs in terms of recall period and item response options. The CFIa is computed as the sum of 14 items, rated on a 5-point Likert scale ranging from Never=0 to Always=4 and referring to the participant's current ability (most recent experience). Total scores range from 0 to 56. Higher scores indicate greater cognitive impairment. Negative change from baseline indicates improvement. The participant (PRO) and study partner (ObsRO) versions of the CFIa were used in this study. ITT Population included all participants randomly assigned to study treatment. Participants were grouped into two arms (placebo/gantenerumab) according to treatment assigned at randomization. Overall number analyzed is the number of participants with data available for analyses.

End point title	Number of Participants with Abnormal Magnetic Resonance Imaging (MRI) Findings: Amyloid-related Imaging Abnormalities – Edema/Effusion (ARIA-E) and ARIA-Hemosiderin Deposition (ARIA-H)
-----------------	--

End point description:

ARIA are an identified risk with anti-amyloid antibodies, including gantenerumab. These changes can be identified on brain MRI. In ARIA-E, (E for edema or effusion), edema can be seen in different areas of the brain on MRI, representing fluid leakage into the brain parenchyma or sulcal spaces. ARIA-H (H for hemosiderosis) are small foci of signal loss observed on MRI sequences sensitive for paramagnetic tissue properties and comprise cerebral microbleeds (small foci of bleeding in the brain parenchyma) and leptomeningeal hemosiderosis (small foci of bleeding on the surface of the brain). These changes also occur sporadically in AD. Safety Evaluable Population included all participants randomly assigned to study treatment and who received at least 1 dose of study drug. Participants were grouped according to the treatment they received at first exposure.

End point title	Change in Brain Amyloid Load Over Time as Measured by Amyloid Positron Emission Tomography (PET) in a Subset of Participants
-----------------	--

End point description:

Brain amyloid load over time was planned to be assessed using [18F] florbetaben or [18F] flutemetamol tracers. These are PET radioligand selective to amyloid. Amyloid PET burden is measured in a composite

region of interest (ROI) by using standardized uptake value ratio (SUVR) mapped to the centiloid scale. The weighted composite target region are composed of (both left and right side): frontal lobe, parietal lobe, temporal lobe lateral, cingulum posterior and anterior cingulate gyrus. The reference region used to normalize the composite region is the whole cerebellum. The centiloid scale anchor points are 0 and 100, where 0 represents a high-certainty amyloid negative scan and 100 represents the amount of global amyloid deposition found in a typical AD scan. Data is not reported as no postbaseline samples were collected due to early termination of study by the sponsor.

Secondary: Change in Brain Tau Load Over Time as Measured by Tau PET in a Subset of Participants

End point title	Change in Brain Tau Load Over Time as Measured by Tau PET in a Subset of Participants
-----------------	---

End point description:

Change in tau load represents how much neurofibrillary tau pathology is present in brain assessed using PET scan. For the longitudinal tau PET assessment, [18F]-MK-6240 was used. Tau load is measured using SUVR in four composite target ROIs: Temporal composite target region included (both left & right) anterior & posterior superior temporal gyrus, posterior temporal lobe, fusiform gyrus, & middle and inferior temporal gyrus; Medial temporal composite region not including hippocampus included (both left & right): amygdala, parahippocampus & anterior medial & lateral temporal lobe; Frontal lobe (both left & right) & Parietal lobe (both left & right). Inferior cerebellar grey matter = reference region for calculating median SUVRs for all four target regions. Data is not reported as no postbaseline samples were collected due to early termination of study by the sponsor.

Dictionary version	25.1
--------------------	------

Reporting groups

Reporting group title	Gantenerumab
-----------------------	--------------

Reporting group description:

Participants received gantenerumab SC injection for a maximum of 172 days. Participants had the option to choose between Q1W or Q2W dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received a dose of gantenerumab 120 mg SC Q4W three times, 255 mg SC Q4W three times, and 255 mg SC Q2W six times, prior to reaching the target dose of 255 mg Q1W (i.e., 1020 mg per month). Participants who chose the Q2W dosing regimen received a dose of gantenerumab 120 mg SC Q4W three times, 255 mg SC Q4W three times, and 510 mg SC Q4W three times, prior to reaching the target dose of 510 mg Q2W (i.e., 1020 mg per month). By the time the study was terminated, none of the participants had reached the target dose.

Reporting group title	Placebo
-----------------------	---------

Reporting group description:

Participants received placebo SC injection for a maximum of 191 days. Participants had the option to choose between Q1W or Q2W dosing regimens for the target dose. A gradual up titration was performed. Participants who chose the Q1W dosing regimen received placebo, SC Q4W six times, and then Q2W six times, prior to reaching the target dose of Q1W. Participants who chose the Q2W dosing regimen received placebo, SC Q4W nine times, prior to reaching the target dose of Q2W. By the time the study was terminated, none of the participants had reached the target dose.

More information

Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
02 November 2021	Protocol WN42444 was amended to address a health authority (HA) requirement. Substantive changes made to the protocol are: 1. Updates made to address a HA requirement to include a COVID-19 vaccination risk assessment. 2. Updates made to clarify the MRI safety monitoring schedule for each study period (initial dose escalation, maintenance dosing, and post-progression dose escalation periods) and dosing schedule (every week [Q1W], every 2 weeks [Q2W], Q4W). 3. Updates made to clarify timing of MRIs related to amyloid-related imaging abnormality (ARIA) management for each study period and dosing schedule. 4. Footnotes were added to tables to clarify the assessment schedule during and following the post-progression dose escalation. 5. Text was updated to clarify that, before a participant entered the post-progression dose escalation period based on having clinically progressed, they need to be on target dose; it was also clarified that, in order to conclude on clinical progression, the change in diagnostic classification must be confirmed on a second visit, approximately 6 months later so that the diagnosis could be considered stable. 6. Pharmacokinetic samples at Week 131 and Week 183 added in schedule of assessment. 7. The process for rescreening was clarified

Notes:

Interruptions (globally)

Were there any global interruptions to the trial? Yes

Date	Interruption	Restart date
11 November 2022	Decision to terminate development of gantenerumab for treatment of prodromal/mild/early stage of Alzheimer disease (AD) as well as in people at risk for or at the earliest stages of AD following results of a pre-planned analysis of the safety and efficacy of gantenerumab in Graduate I&II (WN29922/WN39658).	-

Notes:

Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

SKYLINE study was terminated early & limited data could be collected & analyzed. Hence, no conclusions can be made on effectiveness of gantenerumab in treatment of people at risk for or at earliest stages of AD.

Notes:
