

Clinical trial results:

A multicenter, randomized, open label clinical trial for safety evaluation of an allergen immunotherapy with an accelerated dose escalation schedule using one strength of an aluminium hydroxide adsorbed allergoid preparation of birch pollen allergens in adult and pediatric patients with moderate to severe seasonal allergic rhinitis or rhinoconjunctivitis with or without bronchial asthma.

Summary

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	Yes

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	15 August 2023
Is this the analysis of the primary completion data?	Yes
Primary completion date	29 March 2023
Global end of trial reached?	Yes
Global end of trial date	29 March 2023
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

To evaluate the safety and tolerability of a One strength dose escalation scheme using one strength of Allergovit Birch for allergen immunotherapy (AIT) compared to the standard escalation scheme using 2 strength of Allergovit Birch in adults, adolescents, and children with allergic rhinitis/rhinoconjunctivitis caused by birch pollen allergens with or without allergic asthma on a well-controlled level

Protection of trial subjects:

The trial was conducted in accordance with the ethical principles that have their origin in the Declaration of Helsinki and are consistent with the International Conference on Harmonization of technical requirements for registration of pharmaceuticals for human use (ICH) guidance for Good Clinical Practice (GCP) and the applicable regulatory requirements. Data Safety Monitoring Board (DSMB) was in place throughout the trial; DSMB consisted of 3 independent physicians, experienced in the field of allergy. The primary function of the DSMB was to ensure the subjects' safety. During the whole course of the trial, the DSMB team regularly reviewed an update of the safety data from all treated patients. After each administration of the IMP, each patient in the study was kept under supervision of a qualified and trained investigator for at least 120 min. Safety evaluation during supervision after IMP administration consisted of: FEV1, Systolic BP, Diastolic BP, Heart rate (Pulse rate), Respiratory rate.

Background therapy:

No background therapy was generally planned in this trial. Concomitant medication was defined as any medication other than the IMP that was taken during the clinical trial. Any relevant medication taken before entering the clinical trial was considered as "previous medication". All anti-allergic medication administered in the last 2 years and other medication used during the last 6 weeks prior to enrollment to the trial had to be documented at the screening visit. Medication against rhinitis and rhinoconjunctivitis was permitted, but had to be documented as concomitant medication. Patients with bronchial asthma who required regular basic treatment of their allergic asthma were treated as recommended by GINA (GINA, 2021) to control their asthma. Any asthma medication had to be documented as concomitant medication. Restricted medication and nonpermitted medications were clearly defined in the trial protocol.

Evidence for comparator:

There was no comparator used in this trial.

Abbreviations used in this document: AE=Adverse event, AIT=Allergen immunotherapy, BP=Blood pressure, bpm=Beats per minute, DSMB=Data Safety Monitoring Board, FEV1=Forced expiratory volume in 1 second, GINA=Global Initiative for Asthma, ICF=Informed consent form, IgE = Immunoglobulin E, IgG=Immunoglobulin G, IMP=Investigational medicinal product, MedDRA=Medical Dictionary for Regulatory Activities, RBC=Red blood cells, TEAE=Treatment-emergent adverse event, TU=Therapeutic units, WAO=World Allergy Organization, y=year

Actual start date of recruitment	16 March 2022
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Poland: 206
Country: Number of subjects enrolled	Germany: 39
Worldwide total number of subjects	245
EEA total number of subjects	245

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	69
Adolescents (12-17 years)	63
Adults (18-64 years)	113
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

Overall, 245 patients were screened for eligibility; of these 201 patients were randomized and 200 patients (87 adults, 51 adolescents, and 62 children) were actually treated with at least one dose of IMP (103 in the One Strength group and 97 in the Standard group).

Pre-assignment

Screening details:

Trial patients (outpatients) were included if they were suffering from immunoglobulin (Ig)E-mediated moderate to severe allergic rhinitis or rhinoconjunctivitis, with or without allergic asthma, triggered by house dust mite (HDM) allergens documented by skin prick test (SPT) wheal for HDM and specific IgE value of ≥ 0.70 kU/L to HDM.

Period 1

Period 1 title	Treatment (Overall trial period) (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	One Strength

Arm description:

Patients randomized and treated into the One Strength group (accelerated dose escalation) received 3 injections with increasing doses of only strength B of Allergovit Birch (10 000 TU/mL), followed by 2 injections with the maximum recommended dose.

Arm type	Experimental
Investigational medicinal product name	Allergovit Fagales (100% Birch)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Suspension for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

IMP is an aluminium hydroxide adsorbed allergoid preparation of birch pollen allergens. IMP is available in 2 concentrations (A: 1 000 TU/ml and B: 10 000 TU/ml). In the One Strength group only strength B was used for 3 dose escalation injections (0.1ml, 0.3ml and 0.6ml), followed by 2 maintenance injections of the maximum recommended dose (0.6ml of strength B: 10 000TU).

Arm title	Standard
------------------	----------

Arm description:

Patients randomized and treated into the Standard group (standard dose escalation) received 7 injections with increasing doses of two strengths of Allergovit Birch (strength A: 1 000 TU/mL; strength B: 10 000 TU/mL), followed by 2 injections of the maximum recommended dose.

Note: 98 patients were randomized into the Standard group, but one patient withdraw consent before first treatment.

Arm type	Active comparator
Investigational medicinal product name	Allergovit Fagales (100% Birch)
Investigational medicinal product code	
Other name	
Pharmaceutical forms	Suspension for injection
Routes of administration	Subcutaneous use

Dosage and administration details:

IMP is an aluminium hydroxide adsorbed allergoid preparation of birch pollen allergens. IMP is available in 2 concentrations (A: 1 000 TU/ml and B: 10 000 TU/ml). In the standard group both concentrations were used for 7 dose escalation injections (0.1ml, 0.2ml, 0.4ml, 0.8ml of strength A and 0.15ml, 0.3ml,

0.6ml of strength B), followed by 2 maintenance injections of the maximum recommended dose (0.6ml of strength B: 10 000TU).

Number of subjects in period 1^[1]	One Strength	Standard
Started	103	97
Completed	96	92
Not completed	7	5
Consent withdrawn by subject	1	1
Physician decision	1	-
Adverse event, non-fatal	3	2
Other reason(s)	1	1
Sponsor/DSMB Decision	1	1

Notes:

[1] - The number of subjects reported to be in the baseline period are not the same as the worldwide number enrolled in the trial. It is expected that these numbers will be the same.

Justification: The number of patients enrolled worldwide includes screening failures (i.e. patients that signed the informed consent form, but were not randomized; N=44) and patients that were randomized, but never treated (N= 1). The number of patients in the baseline period equals the number of patients who were actually treated with IMP (= number of patients in the safety set, which was used for all analyses of this trial).

Primary: Treatment Emergent Adverse Events (TEAEs)

End point title	Treatment Emergent Adverse Events (TEAEs) ^[1]
End point description: Number, incidence, time of onset, type and intensity of AEs and serious adverse events (SAE). An adverse event (AE) was defined as any untoward medical occurrence in a patient administered a pharmaceutical product and which did not necessarily have a causal relationship with this treatment. An AE could be any unfavorable and unintended sign (including an abnormal laboratory finding), symptom, or disease temporally associated with the use of an IMP, whether or not related to the IMP. A treatment emergent adverse event (TEAE) was defined as any AE that started or worsened after the first use of trial medication until and including final visit or premature termination visit. Results in the table below summarize the number of patients affected by one or more events events (TEAEs).	
End point type	Primary

End point timeframe:

Between first IMP injection and the final visit. Approximately 9 weeks for patients randomized to One Strength (accelerated dose escalation) and approximately 13 weeks for patients randomized to Standard (standard dose escalation).

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: This was a safety trial with descriptive results evaluation. Descriptive evaluation of group differences. CI for the difference (One Strength - Standard): exact 95%-confidence intervals for the difference in proportions of patients with events (%).

Other pre-specified: Immunological profile (Treatment-induced change in birch specific IgG4)

End point title	Immunological profile (Treatment-induced change in birch specific IgG4)
-----------------	---

End point description:

Changes in the immunological profile of birch-specific IgG4 provides valuable information and evidence for the immunogenic activity of the active preparation. Changes in IgG4 were analyzed as an exploratory parameter. The results (shown as changes from baseline) indicate that for all patients (adults, adolescents and children), during the course of the trial, the median levels of IgG4 specific for Birch pollen (*Betula verrucosa*) increased notably over time in both treatment groups [p-values < 0.0001 between baseline and final visit, for all age groups].

End point type	Other pre-specified
----------------	---------------------

End point timeframe:

To determine the immunological profile, blood was taken at baseline visit and final visit/premature termination of the study.

Adverse events

Adverse events information

Timeframe for reporting adverse events:

The collection of adverse events starts at the day of the patient's signature on the patient informed consent form and is performed until and including the final visit or premature termination visit.

Adverse event reporting additional description:

Results are shown for the safety set (SAF), which includes all patients treated at least with one dose of IMP. Only TEAEs (Treatment-emergent Adverse Events) are shown. PT of Non-serious TEAEs are listed, if at least one age group is above the frequency threshold of 2%.

Assessment type	Systematic

Reporting groups

Reporting group title	Adults (18 to ≤ 65 years), One Strength
-----------------------	---

Reporting group description:

Patients treated according to the One Strength dose escalation scheme (One strength group). Patients in the One Strength group received 3 injections with increasing doses of only strength B of Allergovit Birch (10000 TU/mL), followed by 2 injections with the individual maximum recommended dose.

Reporting group title	Adults (18 to ≤ 65 years), Standard
-----------------------	-------------------------------------

Reporting group description:

Patients treated according to the Standard dose escalation scheme (Standard group). Patients in the Standard group received 7 injections with increasing doses of two strengths of Allergovit Birch (strength A: 1000 TU/mL; strength B: 10000 TU/mL), followed by 2 injections with the maximum recommended dose.

Reporting group title	Adolescents (12 to < 18 years), One Strength
-----------------------	--

Reporting group description:

Patients treated according to the One Strength dose escalation scheme (One strength group). Patients in the One Strength group received 3 injections with increasing doses of only strength B of Allergovit Birch (10000 TU/mL), followed by 2 injections with the individual maximum recommended dose.

Reporting group title	Adolescents (12 to < 18 years), Standard
-----------------------	--
