

## Clinical trial results:

**An International Multicentre, Phase 2, Randomised, Adaptive Protocol to determine the need for, optimal timing of and immunogenicity of administering a booster mRNA vaccination dose against SARS-CoV-2 in the general population (18+ years) already vaccinated against SARS-CoV-2**

## (EU-COVAT-2 BOOSTAVAC)

### Summary

EudraCT number	2021-004889-35
Trial protocol	IE NO DE ES BE
Global end of trial date	23 April 2024

### Results information

Result version number	v1 (current)
This version publication date	11 April 2026
First version publication date	11 April 2026

### Trial information

#### Trial identification

Sponsor protocol code	UCDCRC/21/10
-----------------------	--------------

#### Additional study identifiers

ISRCTN number	-
ClinicalTrials.gov id (NCT number)	-
WHO universal trial number (UTN)	-

Notes:

### Sponsors

Sponsor organisation name	University College Dublin
Sponsor organisation address	Centre for Experimental Pathogen Host Research, Belfield Campus, Dublin, Ireland, D04 V1W8
Public contact	Department of Infectious Diseases, University College Dublin, paddy.mallon@ucd.ie
Scientific contact	Department of Infectious Diseases, University College Dublin, paddy.mallon@ucd.ie

Notes:

### Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

## Results analysis stage

Analysis stage	Final
Date of interim/final analysis	28 January 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	23 April 2024
Global end of trial reached?	Yes
Global end of trial date	23 April 2024
Was the trial ended prematurely?	No

Notes:

## General information about the trial

Main objective of the trial:

To determine the need for, optimal timing of, and immune response after administering a mRNA booster vaccination dose against SARS-CoV-2 in the general population (18+ years) already vaccinated with the mRNA vaccines.

Protection of trial subjects:

The trial was conducted in accordance with the valid versions of the trial protocol and the internationally recognised Good Clinical Practice Guidelines (ICH-GCP), including archiving of essential documents.

The participants volunteering for this trials were not considered to be at additional risk related to the vaccine selected as the intervention. Participants in this study were exposed to some general risks associated with the study procedures. The participants underwent additional blood sampling, which can be uncomfortable but rarely results in any relevant harm or discomfort. Collection of other samples where indicated, saliva or urine, were considered not to cause any significant harm. These risks are almost always short lived and do not result in any long-term effects.

Anxiety-related reactions, including vasovagal reactions (syncope), hyperventilation or stressrelated reactions (e.g. dizziness, palpitations, increases in heart rate, alterations in blood pressure, paraesthesia, hypoaesthesia and sweating) may occur in association with the vaccination process itself. Events of anaphylaxis have been reported following vaccination with COMIRNATY®. Appropriate medical treatment and supervision was always available in case of an anaphylactic reaction following the administration of the vaccine.

Cases of myocarditis and pericarditis have been observed following vaccination with COMIRNATY®. These cases have primarily occurred within 14 days following vaccination.

Solicited AEs, including local and systemic manifestations as well as of symptoms of myocarditis and pericarditis, were collected by the participants in a study diary.

Participants' identities were protected at all times and personal health information held securely. No directly identifiable data was stored in the clinical trial database, and the participant lists were stored separately, secured, at the local study sites.

Background therapy:

Standard of care as per country guidelines

Evidence for comparator: -

Actual start date of recruitment	09 March 2022
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	Yes

Notes:

## Population of trial subjects

### Subjects enrolled per country

Country: Number of subjects enrolled	Norway: 6
Country: Number of subjects enrolled	Spain: 21
Country: Number of subjects enrolled	Sweden: 29

Country: Number of subjects enrolled	Belgium: 37
Country: Number of subjects enrolled	Germany: 51
Country: Number of subjects enrolled	Ireland: 111
Worldwide total number of subjects	255
EEA total number of subjects	255

Notes:

---

### Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	0
Adolescents (12-17 years)	0
Adults (18-64 years)	208
From 65 to 84 years	46
85 years and over	1

## Subject disposition

### Recruitment

Recruitment details:

The first participant was recruited on March 09, 2022, the last one on September 19, 2023.

Total recruitment time: 559 days.

A total of 255 participant were recruited in 14 centres across Europe. The planned sample size of 500 participants was not reached

The last participant completed the study on April 23, 2024

Total study duration: 776 days.

### Pre-assignment

Screening details:

Potential participants were recruited from a European Volunteer Registry for vaccine trials, local site database or local advertising.

Eligible participants included adults who had received more than 3 doses of mRNA vaccine as primary vaccination for COVID-19 at least 3 but no more than 7 months prior to enrolment (consent)

### Period 1

Period 1 title	Baseline (overall period)
Is this the baseline period?	Yes
Allocation method	Randomised - controlled
Blinding used	Not blinded

### Arms

Are arms mutually exclusive?	Yes
<b>Arm title</b>	Arm 2: booster at month 0

Arm description:

Participants randomised to Arm 2 received IMP at the baseline visit.

Arm type	Active comparator
Investigational medicinal product name	COVID-19 Vaccine, mRNA
Investigational medicinal product code	
Other name	COMIRNATY
Pharmaceutical forms	Dispersion for injection
Routes of administration	Injection , Intramuscular use

Dosage and administration details:

Subjects randomised to an intervention will receive a single dose of either Pfizer BNT162b2 or one of the Pfizer Bivalent COVID-19 Vaccines (COMIRNATY® Original/Omicron BA.1 or Original/Omicron BA.4-5) or COMIRNATY® Omicron XBB.1.5, at month 0, 2, 4 or 6 after enrolment as per the allocated study arm.

The choice of Pfizer vaccine administered will be determined by what is recommended within the country and/or what is used as standard clinical care at the study site and will be administered at the clinical site by trained study healthcare personnel.

The vaccine should be administered intramuscularly. The preferred site is the deltoid muscle of the upper arm.

Pharmaceutical form: Concentrate for dispersion for injection

Dosage: 1 dose (day 1 at the allocated visit: month 0, 2, 4, or 6)

<b>Arm title</b>	Arm 3: booster at month 2
Arm description:	
Participants randomised to Arm 3 received IMP at the follow-up visit at month 2	
Arm type	Active comparator

Investigational medicinal product name	COVID-19 Vaccine, mRNA
Investigational medicinal product code	
Other name	COMIRNATY
Pharmaceutical forms	Dispersion for injection
Routes of administration	Injection , Intramuscular use

**Dosage and administration details:**

Subjects randomised to an intervention will receive a single dose of either Pfizer BNT162b2 or one of the Pfizer Bivalent COVID-19 Vaccines (COMIRNATY® Original/Omicron BA.1 or Original/Omicron BA.4-5) or COMIRNATY® Omicron XBB.1.5, at month 0, 2, 4 or 6 after enrolment as per the allocated study arm.

The choice of Pfizer vaccine administered will be determined by what is recommended within the country and/or what is used as standard clinical care at the study site and will be administered at the clinical site by trained study healthcare personnel.

The vaccine should be administered intramuscularly. The preferred site is the deltoid muscle of the upper arm.

Pharmaceutical form: Concentrate for dispersion for injection

Dosage: 1 dose (day 1 at the allocated visit: month 0, 2, 4, or 6)

<b>Arm title</b>	Arm 4: booster at month 4
------------------	---------------------------

**Arm description:**

Participants randomised to Arm 4 received IMP at the follow-up visit at month 4

Arm type	Active comparator
Investigational medicinal product name	COVID-19 Vaccine, mRNA
Investigational medicinal product code	
Other name	COMIRNATY
Pharmaceutical forms	Dispersion for injection
Routes of administration	Injection , Intramuscular use

**Dosage and administration details:**

Subjects randomised to an intervention will receive a single dose of either Pfizer BNT162b2 or one of the Pfizer Bivalent COVID-19 Vaccines (COMIRNATY® Original/Omicron BA.1 or Original/Omicron BA.4-5) or COMIRNATY® Omicron XBB.1.5, at month 0, 2, 4 or 6 after enrolment as per the allocated study arm.

The choice of Pfizer vaccine administered will be determined by what is recommended within the country and/or what is used as standard clinical care at the study site and will be administered at the clinical site by trained study healthcare personnel.

The vaccine should be administered intramuscularly. The preferred site is the deltoid muscle of the upper arm.

Pharmaceutical form: Concentrate for dispersion for injection

Dosage: 1 dose (day 1 at the allocated visit: month 0, 2, 4, or 6)

<b>Arm title</b>	Arm 5: booster at month 6
------------------	---------------------------

**Arm description:**

Participants randomised to Arm 5 received IMP at the follow-up visit at month 6

Arm type	Active comparator
Investigational medicinal product name	COVID-19 Vaccine, mRNA
Investigational medicinal product code	
Other name	COMIRNATY
Pharmaceutical forms	Dispersion for injection
Routes of administration	Injection , Intramuscular use

---

**Dosage and administration details:**

Reporting group description: Participants randomised to arm 1 (control) did not receive vaccination as part of the study	
Subject analysis set title	Full Analysis Set
Subject analysis set type	Full analysis
Subject analysis set description: All randomised participants with available anti-RBD antibody titre at baseline and at Day 14 post booster, analyzed according to intention-to-treat principle.	

### Primary: Composite primary endpoint

End point title	Composite primary endpoint <sup>[1]</sup>
End point description: The primary endpoint comprised a composite endpoint of either an increase in anti-RBD antibody titre to $\geq 500$ IU/mL at day 14 post booster vaccine in those with anti-RBD antibody titre of $\leq 500$ IU/mL immediately before booster vaccination or a 2-fold increase in anti-RBD antibody titre at day 14 following booster dose vaccination in those with anti-RBD titre of $\geq 500$ IU/mL immediately before booster vaccination, as measured by quantitative immunoassay targeting the anti-RBD antibody.	
End point type	Primary
End point timeframe: From baseline to 14-days post booster vaccination	
Notes:	

[1] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.  
Justification: Trial participants in Arm 1 (control arm - no vaccine group) were offered the booster dose at the end of the study but they were not followed up as the vaccine was administered after study completion. Hence they were excluded in the statistical analysis.

End point values	Arm 2: booster at month 0	Arm 3: booster at month 2	Arm 4: booster at month 4	Arm 5: booster at month 6

## Statistical analyses

<b>Statistical analysis title</b>	Primary analysis of the schedule-response relation
-----------------------------------	--

Statistical analysis description:

Since the primary endpoint was analysed using one-sample one-sided hypothesis testing , results presented here points to further analyses that were done if efficacy was met (in the main primary analysis), and this was to determine the optimal timing of a booster dose, by modelling the schedule-response relationship using a logistic regression with fractional polynomials

Comparison groups	Arm 2: booster at month 0 v Arm 3: booster at month 2 v Arm 4: booster at month 4 v Arm 5: booster at month 6
Number of subjects included in analysis	189
Analysis specification	Pre-specified
Analysis type	other <sup>[2]</sup>
P-value	= 0.48 <sup>[3]</sup>
Method	Regression, Logistic

Notes:

[2] - Logistic regression with fractional polynomials to determine trend. Schedule-response relationship by randomisation group.

[3] - The p-value indicates whether the slope is 0 (i.e. no effect of time)

## Secondary: 2-fold increase in RBD antibody titre

End point title	2-fold increase in RBD antibody titre <sup>[4]</sup>
-----------------	--

End point description:

This endpoint describes subjects who received booster vaccination at each specific time point that achieve a 2-fold increase in RBD antibody titre 14 days after the booster vaccine

End point type	Secondary
----------------	-----------

End point timeframe:

14 days after the booster vaccine

Notes:

[4] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period. Justification: Trial participants in Arm 1 (control arm - no vaccine group) were offered the booster dose at the end of the study but they were not followed up as the vaccine was administered after study completion. Hence they were excluded in the statistical analysis.

End point values	Arm 2: booster at month 0	Arm 3: booster at month 2	Arm 4: booster at month 4	Arm 5: booster at month 6

Units: Subjects	29	35	23	26

## Statistical analyses

<b>Statistical analysis title</b>	2-fold increase in anti-RBD titre
-----------------------------------	-----------------------------------

Statistical analysis description:

Determining the optimal timing of a booster dose, by modelling the schedule-response relationship using a logistic regression with fractional polynomials (for time point of last vaccine dose) according to the randomisation group

Comparison groups	Arm 2: booster at month 0 v Arm 3: booster at month 2 v Arm 4: booster at month 4 v Arm 5: booster at month 6
-------------------	---

Number of subjects included in analysis	189
Analysis specification	Pre-specified
Analysis type	other <sup>[5]</sup>
P-value	= 0.48 <sup>[6]</sup>
Method	Regression, Logistic

Notes:

[5] - Testing for slope using a logistic regression with the best fitting fractional polynomial

[6] - The p-value indicates whether the slope is 0 (i.e. no effect of time)

## Secondary: Post anti-RBD ≥ 500 IU/mL

End point title	Post anti-RBD ≥ 500 IU/mL <sup>[7]</sup>
-----------------	--

End point description:

This endpoint describes subjects who received the booster vaccination at each specific time point that achieve an anti-RBD antibody titre 500 IU/mL 14 days after the booster vaccine (regardless of the titre level before booster vaccination),

End point type	Secondary
----------------	-----------

End point timeframe:

From baseline to Day 14 post booster

Notes:

[7] - The end point is not reporting statistics for all the arms in the baseline period. It is expected all the baseline period arms will be reported on when providing values for an end point on the baseline period.

Justification: Trial participants in Arm 1 (control arm - no vaccine group) were offered the booster dose at the end of the study but they were not followed up as the vaccine was administered after study completion. Hence they were excluded in the statistical analysis.

[14] - Testing for slope using a logistic regression with the best fitting fractional polynomial

[15] - The p value indicates whether the slope is 0. (i.e no effect of time)

## Adverse events

### Adverse events information

Timeframe for reporting adverse events:

Solicited AEs: within 7 days after booster dose.

Unsolicited AEs: until the end of trial.

SAEs: up to 3 months post-booster or until study completion, whichever occurs first.

Assessment type	Systematic

## More information

### Substantial protocol amendments (globally)

Were there any global substantial amendments to the protocol? Yes

Date	Amendment
16 December 2021	Version 2.0, dated 16-Dec-2021 and approved in Feb 2022. The first BOOSTAVAC study protocol was developed and approved during the last quarter of 2021, however, a protocol amendment was required soon after the first approval and prior to inclusion of any participant into the study, to adapt the study to the rapidly changing clinical and regulatory environment surrounding the pandemic, which included a change in vaccination guidelines to recommend a third dose vaccine. As such the protocol was amended from a 3rd to 4th dose booster vaccination.
02 May 2022	Version 3.0, dated 02-May-2022 and first approved in Jul 2022: Further adjustments to the study protocol were necessary in response to feedback from regulatory reviews across Europe
26 September 2022	Version 4.0, dated 26-Sep-2022 and first approved in Nov 2022: An expansion of the entry criteria was implemented to enable individuals to participate regardless of the number of prior vaccinations, provided that they had received at least three doses of mRNA COVID-19 vaccines.
14 September 2023	Version 5.0, dated 14-Sep-2023, first approved in Oct 2023: Addition of the new adapted Comirnaty vaccine targeting the Omicron XBB.1.5 subvariant, revised AEs and revised study timelines

Notes:

### Interruptions (globally)

Were there any global interruptions to the trial? No

### Limitations and caveats

Limitations of the trial such as small numbers of subjects analysed or technical problems leading to unreliable data.

The study only included 255 participants (of originally planned size of 500) with statistical power reduced from 93% to 70%.

Notes:
