

Clinical trial results:

Effect of adipose tissue derived mesenchymal stromal cells on autism and leaky gut syndrome. A phase I pilot study.

Summary

EudraCT number	2022-002940-27
Trial protocol	DK
Global end of trial date	20 September 2024

Results information

Result version number	v1 (current)

Paediatric regulatory details

Is trial part of an agreed paediatric investigation plan (PIP)	No
Does article 45 of REGULATION (EC) No 1901/2006 apply to this trial?	No
Does article 46 of REGULATION (EC) No 1901/2006 apply to this trial?	No

Notes:

Results analysis stage

Analysis stage	Final
Date of interim/final analysis	22 April 2025
Is this the analysis of the primary completion data?	Yes
Primary completion date	20 September 2024
Global end of trial reached?	Yes
Global end of trial date	20 September 2024
Was the trial ended prematurely?	No

Notes:

General information about the trial

Main objective of the trial:

The purpose of this dose titrating study was to evaluate the safety and efficacy of an allogeneic adipose tissue-derived mesenchymal stromal/stem cell product (C2C_ASC) in children with autism spectrum disorder (ASD) and gastrointestinal symptoms. Results from this study will be used to support the feasibility and safety of C2C_ASC treatment in children. And further to support the hypothesis of a connection between gastrointestinal symptoms, increased local gastrointestinal and systemic elevated immunological and inflammatory activity, bacterial toxins in the blood and symptoms of autism spectrum disorder that can be reduced or normalized by modulating the immunological activity and inflammation by treatment with mesenchymal stromal/stem cells.

Protection of trial subjects:

Treatment visits was planned at least one week apart, to observe for serious adverse events related to the cell treatment and procedure, before treatment of a new trial subject.

Data monitoring was done for all enrolled trial subjects.

Background therapy: -

Evidence for comparator: -

Actual start date of recruitment	09 June 2023
Long term follow-up planned	No
Independent data monitoring committee (IDMC) involvement?	No

Notes:

Population of trial subjects

Subjects enrolled per country

Country: Number of subjects enrolled	Denmark: 10
Worldwide total number of subjects	10
EEA total number of subjects	10

Notes:

Subjects enrolled per age group

In utero	0
Preterm newborn - gestational age < 37 wk	0
Newborns (0-27 days)	0
Infants and toddlers (28 days-23 months)	0
Children (2-11 years)	3
Adolescents (12-17 years)	7

Adults (18-64 years)	0
From 65 to 84 years	0
85 years and over	0

Subject disposition

Recruitment

Recruitment details:

The trial subjects was recruited through the Department of Child and Adolescent Psychiatry, Psychiatry Clinic South, Aalborg University Hospital, Denmark.

A total number of 10 subjects was planned and enrolled. All 10 subjects received the study intervention and completed the study follow-up.

Pre-assignment

Screening details:

Date of enrolment (first participant's first visit): 05 September 2023

Date of completion (last participant's last visit): 20 September 2024

Key inclusion criteria were:

- Children aged 6 – 14 years
- Diagnosis of autism spectrum disorder (ASD)
- Gastrointestinal symptoms or previous gastrointestinal symptoms

Period 1

Period 1 title	Baseline (overall period)
Is this the baseline period?	Yes
Allocation method	Non-randomised - controlled
Blinding used	Not blinded

Arms

Are arms mutually exclusive?	Yes
Arm title	1 x 1 million ASCs/kg body weight

Arm description:

Trial subject 1-5 was allocated to this arm with one treatment of 1 x 1 million ASCs/kg body weight.

Arm type	Experimental
Investigational medicinal product name	CSCC_ASC5010
Investigational medicinal product code	CSCC_ASC5010
Other name	Allogeneic adipose tissue-derived mesenchymal stromal/stem cells
Pharmaceutical forms	Infusion
Routes of administration	Intravenous use

Dosage and administration details:

The investigational product (IP) was an advanced therapy investigational medicinal product (ATIMP) manufactured from allogeneic adipose tissue-derived mesenchymal stromal/stem cells (ASCs). The active substance is in vitro expanded ASCs. The IP, CSCC_ASC5010, was manufactured as a cryopreserved suspension of 50 million ASCs per ml with a total volume of 1,3 ml per vial.

In chronological order subjects was randomized to a low dose or a high dose where the first 5 enrolled subjects received 1 x 1 million ASCs/kg body weight (low dose), and the last 5 enrolled subjects received 2 x

1 million ASCs/kg body weight (high dose). The IP dose was calculated from the subject's body weight. The calculated dose was extracted from one or more vials and was diluted in 50 ml isotonic saline and infused in a vein in the hand.

Arm title	2 x 1 million ASCs/kg body weight
------------------	-----------------------------------

Primary: Safety

End point title	Safety ^[1]
End point description:	
To assess the safety and tolerability of intravenous administration of a single dose 1 x 1 million ASCs per kg body weight and 2 x 1 million ASCs per kg body weight in children with autism spectrum disorder and gastrointestinal symptoms. Endpoint defined by adverse events (AEs), serious adverse events (SARs), and suspected unexpected serious adverse events (SUSARs).	
End point type	Primary
End point timeframe:	
From treatment to the 12-week follow-up.	

Notes:

[1] - No statistical analyses have been specified for this primary end point. It is expected there is at least one statistical analysis for each primary end point.

Justification: The primary end point is safety registered as the number of safety events, thus no statistical analyses are needed.
